FOREWORD

The COVID-19 pandemic has changed our world immeasurably over the past six months.

I am proud that decades of experience in responding to HIV are being used in the response to the coronavirus, and that activists all over the world are working hard to make sure that the disruption to HIV services is minimized. This report profiles some activists, like Theary So from Cambodia who has been living with HIV for 15 years. Theary provides counselling services every day at the Khmer–Soviet Friendship Hospital in Phnom Penh, the country's first HIV treatment site that is now being used to respond to COVID-19.

Our progress towards ending AIDS as a public health threat by 2030 was already off track before the COVID-19 outbreak. Now this crisis has the potential to blow us even further off course. Modelling conducted on behalf of UNAIDS and the World Health Organization has shown that a six-month disruption to medical supplies could result in an additional 500 000 AIDS-related deaths in sub-Saharan Africa alone by the end of 2021.

We cannot allow the hard-fought gains made in the HIV response to be reversed. Especially as there is still so far to go to finish the job.

Of the 38 million people living with HIV, 25.4 million people are now on treatment. That means 12.6 million people are still waiting. New HIV infections have been reduced by 23% since 2010, thanks in large part to a substantial decrease of 38% in eastern and southern Africa. But HIV infections have increased by 72% in eastern Europe and central Asia, by 22% in the Middle East and North Africa and by 21% in Latin America.

Globally, there were still 690 000 AIDS-related deaths in 2019 and 1.7 million new infections. Our 2020 targets of reducing AIDS-related deaths to fewer than 500 000 and new HIV infections to fewer than 500 000 will be missed.

Gender-based violence and inequalities continue to drive the epidemic. In sub-Saharan Africa, young women and adolescent girls accounted for one in four new infections in 2019, despite making up about 10% of the total population.

It is estimated that globally 243 million women and girls (aged 15–49 years) have been subjected to sexual and/or physical violence perpetrated by an intimate partner in the past 12 months. Meanwhile, we know that women who experience such violence are 1.5 times more likely to acquire HIV than women who have not experienced violence. Among marginalized groups, a high prevalence of violence is also linked with higher rates of HIV infection. Female sex workers have a 30-times greater risk of acquiring HIV than the general population.

We know how to treat HIV and how to prevent people from becoming infected. What we desperately need is a different politics to guarantee that everyone everywhere has the right to health.

This must include concerted efforts to dismantle the injustices and inequalities that put young women and girls, gay men and other men who have sex with men, sex workers, transgender people, people who use drugs, prisoners and migrants at greater risk of becoming infected with HIV.

The HIV prevention crisis must be tackled by granting everyone everywhere the right to health, tearing down the barriers that stop people receiving essential services. In tackling COVID-19, we must learn the painful lessons from a history of unequal access in dealing with HIV. Millions died of AIDS-related illnesses while there were medicines available that could have saved their lives. We must ensure that COVID-19 treatments and an eventual vaccine against the coronavirus are made available to everyone everywhere, free at the point of use. A People's Vaccine.

We need a multisectoral response to HIV and other epidemics by making sure, for example, that boys and girls complete secondary education, that people are no longer criminalized for who they are or who they love, that there is a rights-based public health approach to drug use.

Successful pandemic responses must be rooted in human rights, be evidence-based, community-led and fully funded. We must learn the lesson once and for all.

HIV has been slipping down the international agenda for some years. That is why I am calling on leaders to come forward to support a United Nations General Assembly High-Level Meeting on Ending AIDS in 2021 to address with urgency the outstanding issues that are holding us back from ending the epidemic as a public health threat by 2030.

We must not drop the ball on HIV.

The UNAIDS 2020 global report is a call to action. It highlights the scale of the HIV epidemic and how it runs along the fault lines of inequalities. We can and must close the gaps.

Winnie Byanyima
UNAIDS Executive Director

ATTITUDES TOWARDS
PEOPLE LIVING WITH HIV

The vision of the global HIV response is to achieve three zeros: zero new HIV infections, zero AIDS-related deaths and zero discrimination. Ten years ago, when this vision was first articulated, the three zeros were largely aspirational—a distant dream. Five years later, in 2015, the three zeros served as the basis for the HIV targets within the 2030 Agenda on Sustainable Development. Measurable targets were set for 2030, and the United Nations (UN) General Assembly later articulated interim 2020 milestones in the 2016 Political Declaration on Ending AIDS:

- To reduce new HIV infections to fewer than 500 000 by 2020.
- To reduce AIDS-related deaths to fewer than 500 000 by 2020.
- To eliminate HIV-related stigma and discrimination by 2020.

The first two targets are approximately 75% reductions compared to a 2010 baseline, using the epidemiological estimates from 2016.¹ The elimination target is based on the human rights principle that a single case of discrimination globally is one too many.

With the end of 2020 approaching, the latest data from countries show both progress and challenges. As the complex reality of HIV epidemics is increasingly understood, more HIV responses are sharpening their ability to identify gaps and develop strategies to reach people who are being left behind. However, too few countries have taken sufficient action to reach the interim milestones, leaving the world off track to achieve the three zeros by 2030.

1 UNAIDS epidemiological estimates are revised each year using the latest available data from countries. In 2016, as the Political Declaration on Ending AIDS was being negotiated by UN Member States, UNAIDS estimated that there had been 2 205 000 [1 970 000–2 466 000] new HIV infections and 1 499 000 [1 300 000–1 700 000] AIDS-related deaths in 2010. The updated 2020 estimates suggest that there were 2 145 000 [1 585 000–2 894 000] new HIV infections and 1 137 000 [828 000–1 607 000] AIDS-related deaths in 2010.

PROGRESS ON THE PREVENTION OF HIV TRANSMISSION REMAINS FAR TOO SLOW, WITH THE ESTIMATED TOTAL NUMBER OF NEW INFECTIONS IN 2019 MORE THAN THREE TIMES HIGHER THAN THE MILESTONE THAT WAS SET FOR 2020.

Zero new infections

The estimated 1.7 million people [1.2 million–2.2 million] who acquired HIV worldwide in 2019 marked a 23% decline in new HIV infections since 2010. This was the lowest annual number of new infections since 1989.

However, progress on the prevention of HIV transmission remains far too slow, with the estimated total number of new infections in 2019 more than three times higher than the milestone of 500 000 that was set for 2020. An increasing number of countries are making remarkable progress, but many more are failing to adopt proven methods for preventing HIV infection at the required scale.

Globally, the annual number of new infections has been falling more rapidly among women and girls (a 27% decrease since 2010) than among men and boys (an 18% decrease). There were fewer new infections in 2019 worldwide among women and girls (48% of total infections) than among men and boys (52%). Children (aged 0 to 14 years) accounted for 9% of new infections in 2019, with 84% of child infections occurring in sub-Saharan Africa (see Chapter 2 for trends).

The global decrease in new infections is driven by substantial reductions in new infections in eastern and southern Africa (a 38% reduction since 2010). Reductions were also achieved in the Caribbean (29%), western and central Africa (25%), western and central Europe and North America (15%), and Asia and the Pacific (12%). By contrast, the epidemic continued to grow in eastern Europe and central Asia, with new HIV infections rising by 72% between 2010 and 2019. There were also increases in the Middle East and North Africa (22%) and Latin America (21%).

A majority (62%) of new adult HIV infections globally in 2019 were among key populations and their sexual partners. These populations—which include sex workers, people who inject drugs, prisoners, transgender people, and gay men and other men who have sex with men—constitute small proportions of the general population, but they are at elevated risk of acquiring HIV infection, in part due to discrimination and social exclusion.

Distribution of new HIV infections by gender and population, global, 2019

* Data only included from Asia and the Pacific, the Caribbean, eastern Europe and central Asia, Latin America, and western and central Europe and North America. Source: UNAIDS epidemiological estimates, 2020 (see <https://aidsinfo.unaids.org/>); UNAIDS special analysis, 2020 (see methods annex). Note: Epidemiologic data from transgender populations are available primarily from the Asia and the Pacific, Caribbean and Latin America regions. Sparser data are available from the western and central Europe and North America region. Limited programme data are available from western and central Africa and eastern and southern Africa. Furthermore, data are primarily from transwomen, and among those transwomen, data are frequently from people who sell sex. Only a few data points were available from transmen. Nonetheless, the transgender population and their risks for acquiring HIV should not be fully ignored in UNAIDS analyses.

HIV risks vary by region

HIV risk among adults is higher among specific ages, genders and subpopulations by region, depending on the type of epidemic within the countries, cities and communities of the region. In sub-Saharan Africa, adolescent girls and young women (aged 15 to 24 years) in particular are at higher risk of HIV infection: they accounted for about one in four new infections, despite comprising only 10% of the population. In the region most affected by HIV, eastern and southern Africa, adolescent girls and young women accounted for 30% of new infections.

Outside of sub-Saharan Africa, men accounted for the majority of new adult HIV infections in 2019, ranging from 57% in the Caribbean to 79% in western and central Europe and North America.

Globally in 2019, almost one quarter (23%) of new adult HIV infections were among gay men and other men who have sex with men. This population accounted for more than 40% of new infections in

Asia and the Pacific and Latin America, and nearly two thirds (64%) of new infections in western and central Europe and North America. Young gay men and other men who have sex with men (aged 15 to 24 years) are at particular risk in high-income countries of western and central Europe and North America, accounting for 36% of infections in the region in 2019.

Approximately 10% of new adult HIV infections worldwide were among people who inject drugs. This population made up almost half (48%) of new infections in eastern Europe and central Asia, 43% in the Middle East and North Africa, 17% in Asia and the Pacific, and 15% in western and central Europe and North America. An estimated 8% of new adult infections globally were among sex workers of all genders, while transgender women accounted for a small share of new HIV infections worldwide but disproportionately large shares of new infections in Asia and the Pacific (7%), Latin America (6%) and the Caribbean (5%).

Zero AIDS-related deaths

Increased access to antiretroviral therapy has averted an estimated 12.1 million AIDS-related deaths since 2010. Despite this progress, hundreds of thousands of people are dying each year of a disease that has multiple effective and relatively inexpensive treatment regimens available. The estimated 690 000 [500 000–970 000] lives lost due to AIDS-related illnesses worldwide in 2019 was a 39% reduction since 2010, but a ways off the 2020 target of less than 500 000 deaths.

The generally higher coverage of antiretroviral therapy among women is reflected in the lower number of AIDS-related deaths among women and girls globally in 2019: 300 000 [220 000–420 000] compared with 390 000 [280 000–560 000] among men and boys. There were 46% fewer deaths due to AIDS-related illness among women and girls in 2019 than in 2010, compared with 32% fewer deaths among men and boys over the same period. Even though there are much more females than males among people living with

HIV in sub-Saharan Africa (15.9 million women vs 9.8 million men), the epidemic claimed a similar number of lives in the region in 2019: an estimated 220 000 men and boys and an estimated 220 000 women and girls.

The region with the most rapid scale-up in HIV treatment, eastern and southern Africa, is unsurprisingly also the region with the most rapid decline in AIDS-related mortality: 49% between 2010 and 2019. The impact of expanded access to treatment is also evident in the Caribbean, western and central Africa, and western and central Europe and North America: all three regions had 37% fewer AIDS-related deaths in 2019 than in 2010. There were 28% fewer deaths due AIDS-related illnesses in Asia and the Pacific over the same period, while declines were less dramatic in Latin America (8%) and in the Middle East and North Africa (2%). An opposite trend prevails in eastern Europe and central Asia, where deaths due to AIDS-related causes increased by 24% between 2010 and 2019.

Distribution of new HIV infections by gender and population, by region, 2019

Western and central Europe and North America

Note: Data regarding transgender people in some regions are not available for estimation of new HIV infections among that particular population. The unavailability of data does not imply that transgender people in the region are absent or unaffected by the HIV epidemic, however. It is more likely that they bear a disproportionate burden of HIV infection but are overlooked in surveillance activities for various social and technical reasons.

Zero discrimination

Misinformed fears of HIV infection—and denigrating attitudes and behaviours towards people living with HIV and people at much higher risk of acquiring infection—have been features of the HIV epidemic for decades. HIV-related stigma and discrimination continues to do harm by aggravating the HIV and other health threats that people face, and by obstructing people from acquiring the information and making use of the services they need to protect their health.

Legal systems in many countries are failing to protect the people that HIV responses are trying to reach. Criminalization of same-sex sexual relationships, sex work and drug use give license to discrimination, harassment and violence, isolating key populations and hindering them from accessing vital services. Overly broad criminalization of HIV non-disclosure, exposure or transmission also deters people from seeking to know their HIV status or from accessing HIV services.

Levels of HIV-related stigma and discrimination are currently tracked through population-based surveys, which reveal discriminatory attitudes within the general population, and through surveys that ask people living with HIV and members of key populations whether they have experienced stigma and discrimination within the previous 12 months. Efforts are ongoing to strengthen the monitoring of stigma and discrimination as countries and communities aim to reach the goal of zero discrimination.

The most recent data from population-based surveys show that while discriminatory attitudes towards people living with HIV—measured by whether a person would buy fresh vegetables from a shopkeeper living with HIV—are declining consistently in some countries, they are

rebounding in others. In eastern and southern Africa, for instance, discriminatory attitudes have been reduced in some countries to historically low levels. Elsewhere, however, disconcertingly large proportions of adults continue to hold discriminatory attitudes towards people living with HIV. In 25 of 36 countries with recent data on a composite indicator that includes two types of discriminatory attitudes, more than 50% of people aged 15 to 49 years reported having discriminatory attitudes towards people living with HIV.

Surveys of people living with HIV confirm that stigma and discrimination at health-care facilities—in the shape of denial of care, dismissive attitudes, coerced procedures or breach of confidentiality—remain disturbingly common. This discourages people living with HIV from knowing their HIV status and seeking care. Such poor treatment from health-care providers also makes it more difficult for people living with HIV to adhere successfully to treatment, achieve the sustainable viral load required for their own health and reduce the risk of transmitting HIV to others (1–3).

Across 13 countries with available data, the percentage of people living with HIV who reported being denied health services at least once in the previous 12 months because of their HIV status ranged from 1.7% in Malawi to as high as 21% in Peru and Tajikistan. Coerced medical or health procedures remain common, as do breaches of confidentiality by health-care professionals (reported by at least 15% of people in eight of 13 countries with available data). Significant proportions of people living with HIV also reported that their ability to obtain antiretroviral therapy was conditional on them using certain forms of contraception.

Maximizing the impact of HIV responses

There have been steady reductions in HIV infections in diverse settings where a combination approach to HIV prevention has been followed, including behavioural (e.g., consistent condom use), biomedical (e.g., HIV testing and treatment, voluntary medical male circumcision and pre-exposure prophylaxis) and structural components (e.g., enabling girls to stay in school).

Some epidemic models have suggested that universal HIV testing and treatment, combined with primary prevention, could reduce HIV transmission to such low levels that the epidemic could eventually be eliminated (4). Four large cluster-randomized trials—involving more than a quarter of a million people—in Botswana, Kenya, South Africa, Uganda and Zambia between 2012 and 2018 demonstrated that it is feasible to reach very high coverage of testing and antiretroviral therapy, as

HIV incidence and population-level viremia in clusters from four studies of universal HIV testing and treatment in adults, 2013–2018

Source: Petersen ML, Larmarange J, Wirth K, Skalland T, Ayels H, Kanya MR et al. Population-level viremia predicts HIV incidence across universal test & treat studies. Conference on Retroviruses and Opportunistic Infections (CROI), Boston, 8–11 March 2020. Abstract 47. For a webcast of this presentation, please see: <https://www.croiconference.org/abstract/population-level-viremia-predicts-hiv-incidence-across-universal-test-treat-studies/>.

Note: Population viremia, which is the proportion of all adults (HIV-positive and HIV-negative) with viral non-suppression, was measured at the midpoint of the trials.

**HIV incidence among adolescent girls and young women aged 15 to 24 years,
subnational levels, sub-Saharan Africa, 2019**

Source: UNAIDS epidemiological estimates, 2020 (see <https://aidsinfo.unaids.org/>), see methods annex.

Note: HIV incidence estimated as new HIV infections per 1000 person-years at risk.

Countries: For selected countries in sub-Saharan Africa that had the data required to produce subnational HIV estimates. See table on page 430, annex on methods.

well as very high levels of viral suppression (5). In study areas where HIV viremia—the proportion of the entire population (regardless of HIV status) with detectable viral load—was lower, the incidence of HIV was also lower. This reflects the impact of HIV treatment and other combination prevention services.

Differential impact

New HIV infection rates vary both across and within regions. In sub-Saharan Africa, for example, the incidence of HIV infection among adolescent girls and young women (aged 15 to 24 years) is generally highest in southern Africa, with sub-national data showing how there are districts across the region with high rates of HIV infection. Data collected from specific communities over many years are showing an uneven impact of intensive combination HIV prevention efforts—between men and women, different age groups and different locations.

According to longitudinal data from a cohort of almost 11 000 households, the scale-up of antiretroviral therapy services and voluntary medical male circumcision services in South Africa's KwaZulu-Natal province was followed by substantial declines in the incidence of HIV between 2012 and 2017 (6, 7). However, the reductions in the number of new HIV infections were much larger among men (62%) than women (34%), and they also occurred much earlier among men (6).

The steeper decline in HIV incidence among men may seem counterintuitive, given that women were more likely than men to test for HIV, initiate treatment early, sustain treatment and achieve viral suppression. Among people living with HIV in South Africa and the wider eastern and southern Africa region, HIV-related morbidity and mortality is lower among women than men. However, when it comes to preventing HIV infections, it appears

Trends in HIV incidence and selected determinants by sex, Hlabisa district, KwaZulu-Natal, South Africa, 2010–2017

Source: Vandormael A, Akullian A, Siedner M, de Oliveira T, Bärnighausen T, Tanser F. Declines in HIV incidence among men and women in a South African population-based cohort. *Nature Communications*. 2019;10:5482. <https://doi.org/10.1038/s41467-019-13473-y>

Note: Trends in HIV incidence, self-reported condom use, self-reported voluntary medical male circumcision, opposite-sex antiretroviral therapy coverage, and opposite-sex prevalence of detectable viremia. The figure shows that male HIV incidence began to decline after 2012, following increased voluntary medical male circumcision coverage, female antiretroviral therapy coverage surpassing 35%, and a decrease in the female prevalence of detectable viremia. Declines in female HIV incidence after 2014 correspond with male antiretroviral therapy coverage reaching 35% and declines in the male prevalence of detectable viremia.

that men, at least initially, have been benefitting more from women's stronger engagement with the health-care system and from the impact of the local voluntary medical male circumcision programme (7).

Low treatment coverage and viral suppression rates among men therefore not only threaten their own health, but they also put women at greater risk of HIV infection. As treatment coverage and viral suppression rates among men increase, women's risk of HIV acquisition tends to decrease, especially if other combination prevention services are also in wider use.

In Rakai, Uganda, when combination prevention programmes (including voluntary medical male circumcision, antiretroviral therapy and sexual behaviour change) were scaled up between 2006 and 2016, HIV incidence declined by 42% (8). Similar to the South Africa study, treatment coverage and viral load suppression was consistently higher among women than men, and the HIV incidence declines were steeper among men (54%) than women (32%) (8). However, as HIV testing and treatment efforts intensified, incidence declines accelerated among women, especially young women. The trends among young women were likely due to a combination of increased delay in sexual debut and expanded HIV treatment and voluntary medical male circumcision coverage among men (9).

Similarly, variable declines in HIV incidence are also seen in other studies from sub-Saharan Africa (10, 11). Analysis of data from population-based HIV surveys in Eswatini, Lesotho and South Africa show that high coverage of combination prevention options (including high levels of treatment coverage and viral suppression) drives down the incidence of HIV infection.

Measuring HIV epidemic transitions

Several metrics have been established to measure whether an epidemic is expanding or being brought under control. One of these metrics, the reproduction number of an infectious disease—known as “ R_0 ” or “ R naught”—has entered mainstream discourse during the COVID-19 pandemic. The value of R_0 is the number of number of secondary infections produced by a single infectious person in an otherwise susceptible population.

If R_0 is below 1, the number of new infections will decline and the disease will disappear over the long run; if R_0 is above 1, the number of infections will rise and the disease will continue to spread (12). R_0 has limitations for measuring the trajectory of the HIV epidemic since it does not convey how HIV spreads through a population over a long period of time. R_0 can differ by population

density (rural versus urban) and social structure (low-risk versus high-risk populations), thus a single overarching measure of R_0 may miss pockets of infections where the epidemic is increasing even as the overall trajectory appears to decline.

A similar metric calculates the ratio between the number of new HIV infections and the number of people living with HIV within a population. The incidence:prevalence ratio, which combines two desirable conditions: long, healthy lives for people living with HIV and a reduction in new infections. Assuming an average life expectancy of 30 years after a person acquires HIV infection, the total population of people living with HIV will progressively decrease if there are fewer than three new HIV infections per 100 people living with HIV per year. In such a scenario, the AIDS epidemic gradually disappears.

The global incidence:prevalence ratio was 4.4% in 2019, lower than the 7.0% in 2010; this reflects the important progress made against the epidemic in the past decade. The rate of decline varies among regions. In eastern and southern Africa, the ratio fell steeply from 7.0% in 2010 to 3.5% in 2019, making it a realistic prospect to reach the 3% target in the near future. Progress has been much slower in western and central Africa, however. Western and central Europe and North America as a region has reached an incidence:prevalence ratio of less than 3%, while the Caribbean is not far behind at 3.9%. The remaining regions have changed little since 2010.

Among individual countries, 25 have reached the 3% milestone, which indicates that they are well on the way to ending their AIDS epidemics. Among them are some countries with large epidemics, such as Kenya, South Africa and Zimbabwe.

Another useful metric is the ratio of HIV incidence to AIDS-related mortality. When this ratio is less than 1 there are fewer new infections

than deaths in a year, and thus a net decrease in the number of people living with HIV. The incidence:mortality ratio can be misleading, though. Although high AIDS-related mortality (due, for instance, to inadequate testing and treatment programmes) is certainly not desirable, it can push the incidence:mortality ratio below 1 when new infections are not increasing rapidly. The incidence:mortality ratio is therefore only useful in settings where antiretroviral therapy coverage and viral suppression levels are high and AIDS-related mortality is low—and new HIV infections are even lower.

Not many countries have achieved this. At the end of 2019, only a few countries with large HIV epidemics were approaching that threshold. The incidence:mortality ratio in Eswatini, for example, was estimated at 1.1 in 2019, reflecting steep reductions in new HIV infections and a steady decline in deaths due to AIDS-related illnesses. In South Africa, important progress is also evident, but much work needs to be done to push the ratio to 1.

GLOBAL AND REGIONAL DATA

Global summary of the AIDS epidemic | 2019

Number of people living with HIV	Total	38.0 million	[31.6 million–44.5 million]
	Adults	36.2 million	[30.2 million–42.5 million]
	Women (15+ years)	19.2 million	[16.4 million–22.2 million]
	Children (<15 years)	1.8 million	[1.3 million–2.2 million]

People newly infected with HIV in 2019	Total	1.7 million	[1.2 million–2.2 million]
	Adults	1.5 million	[1.1 million–2.0 million]
	Children (<15 years)	150 000	[94 000–240 000]

AIDS-related deaths in 2019	Total	690 000	[500 000–970 000]
	Adults	600 000	[430 000–840 000]
	Children (<15 years)	95 000	[61 000–150 000]

Global estimates for adults and children | 2019

People living with HIV	38.0 million	[31.6 million–44.5 million]
------------------------	---------------------	-----------------------------

New HIV infections in 2019	1.7 million	[1.2 million–2.2 million]
----------------------------	--------------------	---------------------------

AIDS-related deaths in 2019	690 000	[500 000–970 000]
-----------------------------	----------------	-------------------

About 4500 new HIV infections (adults and children) a day | 2019

- About 59% are in sub-Saharan Africa
- About 400 are among children under 15 years of age
- About 4100 are among adults aged 15 years and older, of whom:
 - almost 47% are among women
 - about 31% are among young people (15–24)
 - about 19% are among young women (15–24)

Global estimates for children (<15 years) | 2019

Children living with HIV	1.8 million	[1.3 million–2.2 million]
New HIV infections in 2019	150 000	[94 000–240 000]
AIDS-related deaths in 2019	95 000	[61 000–150 000]

Regional HIV and AIDS statistics and features | 2019

	Adults and children living with HIV	Adults and children newly infected with HIV	Adult and child deaths due to AIDS
Eastern and southern Africa	20.7 million [18.4 million–23.0 million]	730 000 [580 000–940 000]	300 000 [230 000–390 000]
Western and central Africa	4.9 million [3.9 million–6.2 million]	240 000 [150 000–390 000]	140 000 [100 000–210 000]
Middle East and North Africa	240 000 [170 000–400 000]	20 000 [11 000–38 000]	8 000 [4 900–14 000]
Asia and the Pacific	5.8 million [4.3 million–7.2 million]	300 000 [210 000–390 000]	160 000 [94 000–240 000]
Latin America	2.1 million [1.4 million–2.8 million]	120 000 [73 000–180 000]	37 000 [23 000–56 000]
Caribbean	330 000 [270 000–400 000]	13 000 [8 700–19 000]	6 900 [4 900–10 000]
Eastern Europe and central Asia	1.7 million [1.4 million–1.9 million]	170 000 [140 000–190 000]	35 000 [26 000–45 000]
Western and central Europe and North America	2.2 million [1.7 million–2.6 million]	65 000 [49 000–87 000]	12 000 [8 700–19 000]
GLOBAL	38.0 million [31.6 million–44.5 million]	1.7 million [1.2 million–2.2 million]	690 000 [500 000–970 000]

The ranges around the estimates in this table define the boundaries within which the actual numbers lie, based on the best available information.

Adults and children estimated to be living with HIV | 1990–2019

Adults and children newly infected with HIV | 1990–2019

Adult and child deaths due to AIDS | 1990–2019

EASTERN AND SOUTHERN AFRICA

7 COUNTRIES
HAVE ALREADY REACHED THE 90–90–90
TARGETS, AND 3 OTHERS ARE VERY
CLOSE TO DOING SO

THE REGION'S INCIDENCE:PREVALENCE
RATIO HAS
NARROWED TO 3.5

The decrease in new HIV infections in eastern and southern Africa since 2010 is larger than in any other region. Sustaining that progress demands more effectively addressing the gender dynamics of the epidemic. Three in five new infections in 2019 were among women, and the incidence of HIV infections among adolescent girls and young women (aged 15 to 24 years) remains inordinately high: they are 2.5 times more likely than their male peers to acquire HIV infection. A comprehensive approach is required, including combination prevention programmes that take account of gender inequalities, improving girls' access to secondary education (which can have a protective effect against HIV), and increasing access to sexual and reproductive health services.

The region is closing in on the 90–90–90 testing and treatment targets. Seven countries have reached those Fast-Track Targets (Botswana, Eswatini, Namibia, Rwanda, Uganda, Zambia and Zimbabwe), and three others are very close to doing so (Kenya, Malawi and the United Republic of Tanzania). Despite considerable progress made in reaching people in the region with treatment, the percentage of children with a suppressed viral load was only 40% (compared to 66% among adults). Community-led services within differentiated care approaches are adding vital momentum to treatment programmes.

The roll-out of HIV testing and treatment programmes is reflected in the 49% decrease in AIDS-related deaths since 2010—a steeper reduction than in any other region. Nonetheless, an estimated 300 000 [230 000–390 000] people died due to AIDS-related illnesses in 2019. There is scope for increasing the coverage of HIV testing and treatment among men and young women.

A substantial proportion (roughly one quarter) of new infections are among key populations and their sexual partners, a reminder of the need for conducive laws and policies, and for programmes that serve the HIV-related needs of these populations.

Condom use at last higher-risk sex with a nonmarital, noncohabiting partner in the last 12 months, and lower secondary school completion rate among adolescent girls and young women (ages 15–24 years), eastern and southern Africa, 2012–2018

Source: Population-based surveys, 2012–2018; UNESCO Institute for Statistics (UIS).
Note: Lower secondary school age is approximately 12 to 16 years of age.

There is a positive association between condom use at last higher-risk sex and completion rates of lower secondary school among adolescent girls and young women in eastern and southern Africa. Additionally, greater gains have been made in

reducing new HIV infections among adolescent girls and young women in countries that have higher completion rates for lower secondary school (>50%). Keeping girls in school reduces both HIV risks and new infections.

Relative reduction in new HIV infections since 2010 among adolescent girls and young women (ages 15–24 years), by completion rate for lower secondary school, eastern and southern Africa

HIV testing and treatment

HIV testing and treatment cascade, eastern and southern Africa, 2019

Source: UNAIDS special analysis, 2020 (see methods annex).

Gender differences in key HIV metrics among adults, eastern and southern Africa, 2019

UNAIDS epidemiological estimates 2020 (see <https://aidsinfo.unaids.org/>).

Unequal gender norms contribute to the higher HIV risk faced by women in eastern and southern Africa. Each year, far more women are infected than men, and in 2019, there were 12.3 million women living with HIV in the region compared to 7.3 million men. Higher rates of HIV testing, treatment coverage

and viral load suppression among women, however, translates to lower AIDS-related mortality rates among them compared to men: despite the much larger HIV burden among women, there were more AIDS-related deaths among men (130 000) than women (120 000) in 2019.

90–90–90 country scorecard: Eastern and southern Africa, 2019

	First 90: percentage of people living with HIV who know their status			Second 90: percentage of people who know their status who are on treatment			Third 90: percentage of people living with HIV on treatment who are virally suppressed			Viral load suppression: percentage of people living with HIV who are virally suppressed

Knowledge of status, treatment and viral suppression gaps by country, eastern and southern Africa, 2019

Source: UNAIDS epidemiological estimates, 2020 (see <https://aidsinfo.unaids.org/>).

Among countries in eastern and southern Africa, viral suppression is above 70% for all people living with HIV in eight countries—a remarkable achievement within the region most affected by the HIV pandemic. However, alarming gaps in the HIV testing and treatment cascade exist in many

countries. Testing gaps are particularly large in Madagascar and South Sudan, while in Angola and Mauritius, there are large percentages of people living with HIV who know their HIV status but are not accessing treatment.

New child infections due to gaps in prevention of vertical transmission, eastern and southern Africa, 2017 and 2019

Source: UNAIDS epidemiological estimates, 2020 (see <https://aidsinfo.unaids.org/>).

People-centred services

Services for pregnant women living with HIV, early infant diagnosis, number of new vertical infections and transmission rate, eastern and southern Africa, 2019

Women aged 15 to 49 years who have their demand for family planning satisfied by modern methods, countries with available data, eastern and southern Africa, 2000–2018

Source: Population-based surveys, 2000–2018.

Unmet need for family planning among married and sexually active unmarried adolescent girls and young women (aged 15–24 years), with the proportion of HIV-positive pregnant women aged 15 to 24 years, by country, eastern and southern Africa, 2012–2018

Source: Population-based surveys, 2012–2018; UNAIDS epidemiological estimates, 2020 (see <https://aidsinfo.unaids.org/>).

Population-based surveys show that unmet need for family planning services is generally high among women and adolescent girls in Angola and Comoros. By contrast, unmet need for family planning is generally low in Lesotho, Namibia and Zimbabwe. In six out of 14 countries with recent survey data, unmet need is significantly higher (>1.5 times) among sexually active unmarried adolescent girls or young women than it is among

their married counterparts, which has implications for sexual and reproductive health and rights programming among specific age groups and by marital status. In some countries in the region up to one third of pregnant women living with HIV are in the age group 15 to 24 years. Ensuring that young women living with HIV have the ability to make decisions about their fertility will help to reduce vertical transmission.

Condom use at last sex with nonmarital, noncohabiting partner in the last 12 months among adolescent girls and young women

Source: Population-based surveys, 2014–2018.

Note: Wealth quintile is a composite measure of household asset ownership (e.g., TV sets or bicycles), materials used for housing construction, and types of water access and sanitation facilities.

Evidence from population-based surveys suggest that poorer women are less able to negotiate condom use. In most countries of the region, there is a clear pattern of lower use of condoms at last sex with a nonmarital, noncohabiting partner among adolescent girls and young women in poorer wealth quintiles. Exceptions were Malawi, Rwanda and Uganda. Across the region, condom

use at last high-risk sex is less than 60% for adolescent girls and young women belonging to the poorest wealth quintiles. In several countries (Angola, Madagascar, Uganda and Zambia), condom use at last sex with a nonmarital, noncohabiting partner among adolescent girls and young women is less than 50% across all wealth quintiles.

Investing to end AIDS

A shared commitment to the HIV response among the region's governments and the international community has translated into levels of funding that are in line with the 2020 target. Funding for HIV responses in the region increased by 25% between 2010 and 2019, including a 26% increase in domestic funding, a 50% increase in United States Government bilateral funding and a 18% increase in contributions from the Global Fund to Fight AIDS, Tuberculosis and Malaria (the Global Fund) (all trends measured in constant 2016 US dollars to control for inflation).

HIV financing peaked in 2017 and then declined by 12% between 2017 and 2019. Financing for HIV between 2018 and 2019 decreased from nearly all

sources: domestic (-5%), United States Government bilateral (-5%) and other international sources (-10%). The Global Fund, however, increased investments in the region by 5% between 2018 and 2019, following a 14% decrease in the previous year—a pattern that likely reflects fluctuations in grant management cycles.

Domestic sources accounted for 41% of total HIV funding in 2019, United States Government bilateral funding for 40% and the Global Fund for 10%. South Africa was responsible for most of the domestic spending in eastern and southern Africa, with the other countries in the region depending on external sources for about 80% of their HIV response financing.

Resource availability for HIV by source, 2010–2019, and estimated Fast-Track resource needs in 2020, eastern and southern Africa

Source: UNAIDS financial estimates, 2020 (see <http://hivfinancial.unaids.org/hivfinancialdashboards.html>).

Total HIV resource availability per person living with HIV, HIV incidence and AIDS-related mortality rates in low- and middle-income countries, eastern and southern Africa, 2010–2019 and 2020 target

SURVEY DATA

The HIV epidemic in western and central Africa has not received the same domestic and international attention as in eastern and southern Africa. As a result, progress has been lower. Humanitarian challenges caused by armed conflict, population displacement, food insecurity and intercommunal strife continue to strain community resilience and health systems in several countries in the region.

Women and girls accounted for 58% of the estimated 240 000 [150 000–390 000] new infections in 2019, reflecting the continuing role of gender inequalities in the region's epidemic. In particular, adolescent girls and young women remain at higher risk of HIV infection in western and central Africa. Furthermore, surveys conducted between 2015 and 2018 show that just 37% of young women (aged 15 to 24 years) in the region demonstrated comprehensive knowledge of HIV.

Prevention programmes also do not focus sufficiently on key populations, who make up a large share of new infections and who also contend with hostile legal and social environments. About two thirds of new adult HIV infections in 2019 were among sex workers (19%), gay men and other men who have sex with men (21%), and the clients of sex workers and the sexual partners of people belonging to key populations (27%).

The region remains a long way from reaching the 90–90–90 targets. Only 58% of people living with HIV were accessing antiretroviral therapy in 2019. An estimated 58% [40–78%] of pregnant women living with HIV received antiretroviral therapy to prevent vertical transmission of HIV and protect their own health in 2019, among the lowest coverage in the world.

New child infections due to gaps in prevention of vertical transmission, western and central Africa, 2017–2019

Source: UNAIDS epidemiological estimates, 2020 (see <https://aidsinfo.unaids.org/>).

Gaps along the continuum of services for the prevention of mother-to-child HIV transmission in western and central Africa are leaving too many children exposed to HIV. The vast majority of new child HIV infections in the region are due to the low coverage of antiretroviral therapy among pregnant women living with HIV: 42% of child infections in 2019 occurred because HIV-positive expectant mothers did not receive antiretroviral medicines during pregnancy. A further 18% of new child infections occurred because mothers living with HIV did not receive antiretroviral medicines during breastfeeding, and another 14% occurred because the mother seroconverted during breastfeeding.

Investing to end AIDS

The resources available for HIV responses in western and central Africa in 2019 were only 46% of the 2020 target. HIV financing in the region peaked in 2013, with funding from all sources declining by 14% between 2015 and 2019 (all trends measured in constant 2016 US dollars to control for inflation). The sources of funding for HIV responses in the region have been domestic spending (36% in 2019), United States Government bilateral contributions (35% in 2019) and the Global Fund to Fight AIDS, Tuberculosis and Malaria (20% in 2019).

United States Government bilateral contributions and Global Fund financing have increased by 20% and 55%, respectively, between 2010 to 2019, while domestic resources decreased by 1% and other international contributions decreased by 77% over the same period. All funding sources experienced declines between 2018 and 2019, except for the Global Fund, which increased by 10% after having decreased disbursements in the region by 23% from 2017 to 2018 due to grant management cycles.

HIV COMORBIDITIES

Estimated number of incident tuberculosis cases among people living with HIV (2018) 1000 [670–1500]

People living with HIV who started TB preventive therapy (2018) ...

Cervical cancer screening of women living with HIV ...

People coinfectd with HIV and hepatitis C virus starting hepatitis C treatment ...

HIV PREVENTION

Adults aged 15+ years with unsuppressed viral load ...

Knowledge of HIV prevention among young people aged 15–24 years (2018)

— Women 15.6%
— Men 16.2%

Condom use at last sex with a non-marital, non-cohabiting partner among people aged 15–49 years (2018)

— Women 15.3%
— Men 39.1%

Women aged 15–49 years who have their demand for family planning satisfied by modern methods (2018) 41.4%

Men aged 15–49 years who are circumcised (2013) Not applicable

Voluntary medical male circumcisions performed according to national standards Not applicable

People who received PrEP at least once during the reporting period ...

Harm reduction

— Use of sterile injecting equipment at last injection ...
— Needles and syringes distributed per person who injects (2017) 2
— Coverage of opioid substitution therapy ...
— Naloxone available (2019) No
— Safe injection rooms available (2019) No

GREATER ACCESS TO HIV TREATMENT HAS

REDUCED AIDS-RELATED DEATHS BY 29%

SINCE 2010

5 COUNTRIES

HAVE PREP PROGRAMMES ROLLING OUT NATIONALLY, AND 7 HAVE PILOT OR DEMONSTRATION PROJECTS

HIV infections in Asia and the Pacific have declined slightly, with reductions in Cambodia, Myanmar, Thailand and Viet Nam offset by sharp increases in Pakistan and the Philippines. Key populations and their partners accounted for an estimated 98% of new HIV infections, and more than one quarter of new HIV infections were among young people (aged 15 to 24 years). Rising numbers of new infections among gay men and other men who have sex with men are a major concern. An overall slowing in reductions in new HIV infections coincides with a decline in political and programmatic commitment, alongside punitive laws and policies and rising stigma and discrimination that block effective AIDS responses.

Key populations are insufficiently served by HIV prevention programmes. Some progress has been made in introducing innovative prevention tools, such as pre-exposure prophylaxis (PrEP). A small minority of countries have both high coverage of needle-syringe programmes and moderate coverage of opioid substitution therapy. Evidence indicates increased use of methamphetamine drugs linked to HIV transmission, and there is a need for innovative harm reduction services that respond to changing patterns in drug use. Civil society organizations are widely involved in HIV prevention programmes, but these community-led services are not available at sufficient scale.

The 29% reduction in AIDS-related deaths since 2010 speaks to successful testing and treatment programmes in several countries. Australia, Cambodia and Thailand have achieved the 90–90–90 targets, but AIDS-related mortality rates are rising in Afghanistan, Pakistan and the Philippines. Late diagnosis and poor adherence to treatment are missed opportunities to prevent onward transmission and AIDS-related deaths. About half of key populations living with HIV are not aware of their HIV status, but assisted testing and self-testing could increase the rates of HIV diagnosis.

Status of PrEP availability in Asia and the Pacific, 2019

Source: Prepared by www.aidsdatahub.org, based on: UNAIDS Global AIDS Monitoring, 2020 (see <https://aidsinfo.unaids.org/>); UNAIDS National Commitments and Policy Instrument, 2020 (see <http://lawsandpolicies.unaids.org/>); and information from national programmes.

PrEP is an additional prevention choice for people at substantial risk of HIV infection. Outstanding examples have been set by Australia, Cambodia, New Zealand, Thailand and Viet Nam, with PrEP rolling out and PrEP provision increasing. The

population-level prevention benefits of PrEP, however, have not yet been realized in most countries of the region because its availability and accessibility is still limited.

HIV testing and treatment

HIV testing and treatment cascade, Asia and the Pacific, 2019

Source: UNAIDS special analysis, 2020 (see methods annex).

Credit: UNAIDS

Trends in change in CD4 level among people newly diagnosed with HIV, Asia and the Pacific, 2017–2019

Despite progress on HIV testing, treatment and viral suppression in the region, a significant proportion of people living with HIV have low CD4 counts upon diagnosis, suggesting that they

acquired HIV some time ago. Early diagnosis, treatment initiation and viral suppression is critical to maximizing treatment outcomes and the preventative benefits of antiretroviral therapy.

People-centred services

Services for pregnant women living with HIV, early infant diagnosis, number of new vertical infections and transmission rate, Asia and the Pacific, 2019

Source: UNAIDS epidemiological estimates 2020 and Global AIDS Monitoring 2020 (see <https://aidsinfo.unaids.org/>).

Women aged 15 to 49 years who have their demand for family planning satisfied by modern methods, countries with available data, Asia and the Pacific, 2000–2018

Source: Population-based surveys, 2000–2018.

Note: Data for Afghanistan (2015), Bangladesh (2014) and Pakistan (2017–2018) are only for currently married women.

Prevention intervention coverage among key populations, select countries, Asia and the Pacific, 2016–2019

^a Calculated based on 12 reporting countries for female sex workers and gay men and other men who have sex with men, seven reporting countries for transgender people, and eight reporting countries for people who inject drugs.

Source: UNAIDS Global AIDS Monitoring, 2020 (see <https://aidsinfo.unaids.org/>).

Note: Prevention coverage is measured as the percentage of people in a key population who report having received a combined set of HIV prevention interventions in the past three months (at least two out of three services: 1) given condoms and lubricants; 2) received counselling on condom use and safe sex; 3) tested for STIs for transgender people, sex workers and gay men and other men who have sex with men, or received sterile needles or syringes for people who inject drugs).

Only one quarter of gay men and other men who have sex with men and people who inject drugs in the region—and less than half of transgender people and female sex workers—receive the HIV

prevention services they need. These regional averages obscure variations in coverage across Asia and the Pacific.

Coverage of needle–syringe programmes and opioid substitution therapy among people who inject drugs, reporting countries, Asia and the Pacific, 2019

^a Data are from 2016 data for opioid substitution therapy and 2018 for needle–syringe programme coverage.

^b Data are from 2018.

Source: UNAIDS Global AIDS Monitoring, 2016–2020 (see <https://aidsinfo.unaids.org/>).

High coverage of both needle–syringes programmes (>200 needles and syringes per person who injects drugs per year) and moderate coverage of opioid substitution therapy services (between 20% and 40% of people who inject drugs) have been reported in Cambodia, India and

Myanmar. Needle–syringe programme coverage is low in Indonesia, Malaysia, Pakistan and Thailand, and opioid substitution therapy services are either not available or the coverage is 10% or lower in Afghanistan, Bangladesh, Indonesia, Nepal, Pakistan and Thailand.

Service gap to tuberculosis case-finding and HIV testing

Source: Global tuberculosis report, 2019. Geneva: WHO; 2019.

Tuberculosis is one of the top 10 causes of death worldwide, and it is the leading cause of death among people living with HIV. Almost half (46%) of diagnosed tuberculosis patients in Asia and the

Pacific do not know their HIV status, and about one in four estimated tuberculosis cases in the region are undiagnosed.

Investing to end AIDS

Resource availability for HIV by source, 2010–2019, and estimated Fast-Track resource needs in 2020, Asia and the Pacific

Source: UNAIDS financial estimates, 2020 (see <http://hivfinancial.unaids.org/hivfinancialdashboards.html>).

Recent overall trends in funding for HIV responses in Asia and the Pacific (measured in constant 2016 US dollars to account for inflation) largely reflect trends in domestic funding, which accounted for 81% of the total spending on HIV in the region in 2019. United States Government bilateral contributions and those from the Global Fund to Fight AIDS, Tuberculosis and Malaria (the Global Fund) accounted for 5% and 6%, respectively, of total resource availability in the region in 2019. Other international sources accounted for 9%.

HIV resource availability from domestic sources increased by 87% between 2010 and 2019. By contrast, all international sources of HIV funding declined by 63% over the same period,

including a 14% fall in United States Government bilateral funding, a 28% decline in Global Fund contributions and a 28% decline in funding from other international sources. These declines mostly affect HIV prevention services for key populations, which are heavily dependent on international funding, while domestic resources often prioritize funding for HIV treatment and care. The overall HIV funding in the region is 66% of its 2020 target.

The Global Fund was the only rising source of funds between 2018 and 2019, with a 10% increase in disbursements that followed a 31% decrease the previous year—fluctuations that are due to grant management cycles.

Total HIV resource availability per person living with HIV, HIV incidence and AIDS-related mortality rates in low- and middle-income countries in Asia and the Pacific, 2010–2019 and 2020 target

Source: UNAIDS financial estimates, 2020 (see <http://hivfinancial.unaids.org/hivfinancialdashboards.html>).
 Note: resource availability is in constant 2016 US dollars

People living with HIV (men, 15+)	4800 [4200–5400]	6200 [5400–7100]	7100 [6300–8100]
HIV prevalence (15–49)	0.3 [0.2–0.3]	0.3 [0.2–0.3]	0.3 [0.3–0.4]

LAWS AND POLICIES

Laws criminalizing the transmission of, non-disclosure of or exposure to HIV transmission	Yes
Criminalization of sex work among consenting adults	Any criminalization or punitive regulation of sex work
Criminalization of same-sex sexual acts	Laws penalizing same-sex sexual acts have been decriminalized or never existed
Drug use or possession for personal use is an offence	Possession of drugs for personal use is specified as a criminal offence or drug use or consumption is a specific offence in law
Criminalization of transgender people	Neither criminalized nor prosecuted
Laws or policies restricting the entry, stay and residence of people living with HIV	No
Parental consent for adolescents to access HIV testing	Yes, for adolescents younger than 14 years
Spousal consent for married women to access sexual and reproductive health services	No
Mandatory HIV testing for marriage, work or residence permits or for certain groups	Yes

STIGMA AND DISCRIMINATION

Percentage of women aged 15–49 years who report discriminatory attitudes towards people living with HIV	2017 48.1
---	--------------

Percentage of people living with HIV denied health services because of their HIV status in the last 12 months

Percentage of people living with HIV who reported a health-care professional told others about their HIV status without their consent

VIOLENCE

Proportion of ever-married or partnered women aged 15–49 years who experienced physical or sexual violence from a male intimate partner in the past 12 months	2014 6.4
---	-------------

Laws criminalizing the transmission of, non-disclosure of or exposure to HIV transmission	Yes
Criminalization of sex work among consenting adults	Any criminalization or punitive regulation of sex work
Criminalization of same-sex sexual acts	Laws penalizing same-sex sexual acts have been decriminalized or never existed
Drug use or possession for personal use is an offence	...
Criminalization of transgender people	Neither criminalized nor prosecuted
Laws or policies restricting the entry, stay and residence of people living with HIV	No
Parental consent for adolescents to access HIV testing	Yes, for adolescents younger than 18 years
Spousal consent for married women to access sexual and reproductive health services	No
Mandatory HIV testing for marriage, work or residence permits or for certain groups	No

STIGMA AND DISCRIMINATION

Percentage of women aged 15–49 years who report discriminatory attitudes towards people living with HIV	2017
	71.2

Percentage of people living with HIV denied health services because of their HIV status in the last 12 months

Percentage of people living with HIV who reported a health-care professional told others about their HIV status without their consent

VIOLENCE

Proportion of ever-married or partnered women aged 15–49 years who experienced physical or sexual violence from a male intimate partner in the past 12 months	2013	2017
	7.1	5.5

77% OF PEOPLE

LIVING WITH HIV IN THE
REGION KNOW THEIR HIV STATUS,
AND 60% ARE ON TREATMENT

**IN 4 OF 5
COUNTRIES**

WITH RECENT DATA, MORE THAN
ONE THIRD OF ADULTS EXPRESS
DISCRIMINATORY ATTITUDES
TOWARDS PEOPLE LIVING WITH HIV

**6% OF NEW
INFECTIONS**

IN THE REGION ARE AMONG
TRANSGENDER PEOPLE

Gains have been made against the humanitarian crises in Latin America, but high levels of migration are stressing health care and education systems as well as labour markets. Marginalization of key populations, competing public health priorities and limited government investment in health systems has largely stalled progress against HIV. New infections have climbed in recent years.

HIV-affected populations in the region continue to experience high levels of stigma and discrimination and violence, preventing many from seeking and accessing services. Nearly a quarter of people living with HIV do not know their HIV status, and 40% are not accessing antiretroviral therapy.

Sustained progress has been made in HIV testing and antiretroviral therapy coverage among pregnant women in the region, leading to a reduction in the rate of mother-to-child HIV transmission, which declined from 20% [12–24%] in 2010 to 15% [12–18%] in 2019. Progress varies between countries, with several approaching the goal of eliminating mother-to-child HIV transmission.

Brazil is the only country in the region that provides pre-exposure prophylaxis (PrEP) through the public health system. However, PrEP is also available through private clinics, the Internet, nongovernmental organizations and pilot studies in Chile, Colombia, Costa Rica, Ecuador, Guatemala, Haiti, Mexico, Panama, Paraguay, Peru and Uruguay. The overall number of people on PrEP across the region remains insufficient to have a significant impact on the epidemic. HIV self-testing and the transition to dolutegravir-based first-line treatment regimens are moving forward in countries in the region.

Antiretroviral therapy coverage among people living with HIV and universal health care coverage, Latin America, 2019

Source: UNAIDS epidemiological estimates, 2020 (see <https://aidsinfo.unaids.org/>); Global Health Observatory [database]. Geneva: WHO; c2020 (<https://www.who.int/data/gho/data/major-themes/universal-health-coverage-major>).

Coverage of universal access to health care is higher than antiretroviral therapy coverage in at least 11 countries within Latin America, suggesting obstacles to accessing HIV-related services relative to other health services among people living with HIV. Recent Stigma Index studies show that 21% of people living with HIV in Peru and 2% in Brazil report having been denied health services due to their HIV status. In Guatemala, 6% of women living with HIV and 3% of men living with HIV said they had been denied health services. In Panama, 11% of transgender women living with HIV reported being denied health services, compared to 4% of women living with HIV and 2% of men living with HIV.

HIV testing and treatment

HIV testing and treatment cascade, Latin America, 2019

Source: UNAIDS special analysis, 2020 (see methods annex).

Estimates of gaps in knowledge of status, HIV treatment and viral suppression among people living with HIV, by sex, Latin America, 2019

Source: UNAIDS epidemiological estimates, 2020 (see <https://aidsinfo.unaids.org/>); UNAIDS Global AIDS Monitoring, 2020 (see <https://aidsinfo.unaids.org/>).

Knowledge of status, treatment coverage and viral suppression in Latin America are higher among women living with HIV than among men living with HIV. Notable exceptions are Chile and Guatemala.

90–90–90 country scorecard: Latin America, 2019

	First 90: percentage of people living with HIV who know their status			Second 90: percentage of people who know their status who are on treatment			Third 90: percentage of people living with HIV on treatment who are virally suppressed			Viral load suppression: percentage of people living with HIV who are virally suppressed

People-centred services

Services for pregnant women living with HIV, early infant diagnosis, number of new vertical infections and transmission rate, Latin America, 2019

Source: UNAIDS epidemiological estimates, 2020 (see <https://aidsinfo.unaids.org/>); UNAIDS Global AIDS Monitoring, 2020 (see <https://aidsinfo.unaids.org/>).

Percentage of infants born to pregnant women living with HIV who received an HIV test within two months of birth, Latin America, 2019

Source: UNAIDS epidemiological estimates, 2020 (see <https://aidsinfo.unaids.org/>); Global Health Observatory [database]. Geneva: WHO; c2020 (<https://www.who.int/data/gho/data/major-themes/universal-health-coverage-major>).

Swift testing of infants exposed to HIV and an immediate start of antiretroviral therapy upon diagnosis are the first steps to ensuring the survival of children who have acquired HIV. Coverage of virological testing for early infant diagnosis in Latin America varies from 79% in Honduras to 18% in Colombia.

Women aged 15 to 49 years who have their demand for family planning satisfied by modern methods, countries with available data, Latin America, 2014–2015

Source: Population-based surveys, 2014–2015.

Proportion of people living with HIV who started preventative treatment for tuberculosis infection, Latin America, 2019

Source: UNAIDS Global AIDS Monitoring, 2020 (see <https://aidsinfo.unaids.org/>).

Tuberculosis is the most common cause of premature death among people living with HIV globally. Despite this heightened risk, large gaps in preventive treatment for tuberculosis infection for people living with HIV exist in many countries of the region.

Investing to end AIDS

Resource availability for HIV by source, 2010–2019, and estimated Fast-Track resource needs in 2020, Latin America

Source: UNAIDS financial estimates, 2020 (see <http://hivfinancial.unaids.org/hivfinancialdashboards.html>).

Financing for HIV responses in Latin America has increased steadily since 2010, and by 2019, the resources available had reached 96% of the 2020 target. Domestic sources accounted for 96% of total funding in 2019, while the Global Fund to Fight AIDS, Tuberculosis and Malaria (the Global Fund) accounted for 1%, United States Government bilateral sources accounted for 0.2% and other international sources accounted for 2%.

HIV resource availability from domestic sources almost doubled (a 91% increase) between 2010 and 2019, while contributions from United States

Government bilateral sources and the Global Fund decreased by 71% and 47%, respectively (all trends are measured in 2016 US dollars to control for inflation). Funding from all other international sources increased by 32% during this nine-year period.

The majority of countries in the region have increased their HIV response investments in recent years. Total resource availability for HIV in the region increased 12% between 2017 and 2019 and 21% between 2018 and 2019.

Total HIV resource availability per person living with HIV, HIV incidence and AIDS-related mortality rates in low- and middle-income countries, Latin America, 2010–2019 and 2020 target

Source UNAIDS financial estimates, 2020 (see <http://hivfinancial.unaids.org/hivfinancialdashboards.html>).
 Note: Resource availability per person living with HIV and resource needs are in constant 2016 US dollars.

LAWS AND POLICIES

Laws criminalizing the transmission of, non-disclosure of or exposure to HIV transmission	No, but prosecutions exist based on general criminal laws
Criminalization of sex work among consenting adults	Sex work is not subject to punitive regulations or is not criminalized
Criminalization of same-sex sexual acts	Laws penalizing same-sex sexual acts have been decriminalized or never existed
Drug use or possession for personal use is an offence	Possession of drugs for personal use or drug use and/or consumption are specified as criminal offences
Criminalization of transgender people	Neither criminalized nor prosecuted
Laws or policies restricting the entry, stay and residence of people living with HIV	Require HIV testing or disclosure for some permits
Parental consent for adolescents to access HIV testing	No
Spousal consent for married women to access sexual and reproductive health services	No
Mandatory HIV testing for marriage, work or residence permits or for certain groups	Yes

STIGMA AND DISCRIMINATION

Percentage of women aged 15–49 years who report discriminatory attitudes towards people living with HIV	2016
	35

Percentage of people living with HIV denied health services because of their HIV status in the last 12 months	2016
	16.5

Percentage of people living with HIV who reported a health-care professional told others about their HIV status without their consent	2016
	19.8

VIOLENCE

Proportion of ever-married or partnered women aged 15–49 years who experienced physical or sexual violence from a male intimate partner in the past 12 months

VERTICAL TRANSMISSION OF HIV HAS

DECREASED BY NEARLY 50%

SINCE 2010

Across the Caribbean, progress has been made in reducing new HIV infections and AIDS-related deaths, with the incidence:prevalence ratio of the region decreasing steadily from 6.1% in 2010 to 3.9% in 2019.

Great strides continue to be made in the Caribbean towards the elimination of mother-to-child HIV transmission, with seven countries achieving revalidation. More than 90% of pregnant women living with HIV knew their status in five of the nine countries in the region that reported 2019 data to UNAIDS. Scale-up of effective strategies is needed to ensure early presentation for antenatal care and continuity of treatment for pregnant women living with HIV, including those in poverty and those who are migrants or survivors of gender-based violence.

Progress across the testing and treatment cascade has slowed, highlighting the need to expand proven methods of active case-finding and linkage to (and retention in) care, including through community-based programmes. Roll-out of comprehensive prevention interventions is also incomplete in the region. The Bahamas and Barbados remain the only countries that have national programmes providing pre-exposure prophylaxis (PrEP) through the public health sector. Nongovernmental organizations are providing PrEP in the Dominican Republic, and it is available in Jamaica and Suriname through the private sector and pilot studies.

An ongoing challenge for HIV responses in the region is high levels of migration that place health-care systems, education systems and labour markets under pressure. Government health systems are also struggling to absorb programmes that are traditionally funded by international donors, including HIV prevention and key population-focused initiatives. Innovative financing strategies are needed to ensure sustained progress.

Proportion of infants born to mothers living with HIV who received an HIV test within two months of birth, Caribbean, 2019

Source: UNAIDS Global AIDS Monitoring, 2020 (see <https://aidsinfo.unaids.org/>).

Note: Includes only countries with valid estimates of women eligible for prevention of mother-to-child HIV transmission services.

Swift testing of infants exposed to HIV and an immediate start of antiretroviral therapy upon diagnosis are the first steps to ensuring the survival of children who have acquired HIV. Coverage of

virological testing for early infant diagnosis in the Caribbean varies from 21% in Jamaica to 99% in Cuba.

HIV prevalence among transgender women, female sex workers and all women aged 15 to 49 years, Caribbean, 2015–2019

Source: UNAIDS epidemiological estimates, 2020 (see <https://aidsinfo.unaids.org/>); UNAIDS Global AIDS Monitoring, 2015–2020 (see <https://aidsinfo.unaids.org/>).

Transphobia, social exclusion, violence and stigma are among the intersecting factors that exacerbate the vulnerability of transgender people to HIV infection and other health threats. Among countries in the Caribbean with recent survey data,

HIV prevalence among transgender women is higher than among female sex workers. More than half of transgender women surveyed by a study in Jamaica were found to be living with HIV.

Estimates of gaps in knowledge of status, HIV treatment and viral suppression among people living with HIV, by sex, Caribbean, 2019

Source: UNAIDS epidemiological estimates, 2020 (see <https://aidsinfo.unaids.org/>); UNAIDS Global AIDS Monitoring, 2020 (see <https://aidsinfo.unaids.org/>).

Uptake of HIV testing and treatment services in the Caribbean is significantly higher among women living with HIV than among men living with HIV. For example, viral suppression among women

living with HIV in the region is 13 percentage points higher than among their male peers. This gap is slightly smaller in the Dominican Republic and Haiti.

90–90–90 country scorecard: Caribbean, 2019

	First 90: percentage of people living with HIV who know their status			Second 90: percentage of people who know their status who are on treatment			Third 90: percentage of people living with HIV on treatment who are virally suppressed			Viral load suppression: percentage of people living with HIV who are virally suppressed

Investing to end AIDS

The resources available for HIV responses in the Caribbean peaked in 2013 and declined precipitously until 2016, followed by a recovery through 2018. HIV response resources then declined by 22%, leaving the region at just 42% of its 2020 target.

The main source of funding for HIV responses in the region is United States Government bilateral sources, which accounted for 54% of the total in 2019. Domestic resources constituted 28% of the

total, the Global Fund to Fight AIDS, Tuberculosis and Malaria (the Global Fund) accounted for 16% and other international sources accounted for 1%. HIV resource availability from domestic sources increased by 38% from 2010 to 2019, while funding from United States Government bilateral sources, the Global Fund and all other international sources decreased by 19%, 30% and 92%, respectively (all trends measured in constant 2016 US dollars to control for inflation). The Global Fund is the only source that increased between 2018 and 2019.

Resource availability for HIV by source, 2010–2019, and estimated Fast-Track resource needs in 2020, Caribbean

COUNTRY DATA

LAWS AND POLICIES

Laws criminalizing the transmission of, non-disclosure of or exposure to HIV transmission	No
Criminalization of sex work among consenting adults	Sex work is not subject to punitive regulations or is not criminalized
Criminalization of same-sex sexual acts	Yes, imprisonment (up to 14 years)
Drug use or possession for personal use is an offence	Possession of drugs for personal use or drug use or consumption are specified as a criminal offence
Criminalization of transgender people	Neither criminalized nor prosecuted
Laws or policies restricting the entry, stay and residence of people living with HIV	No
Parental consent for adolescents to access HIV testing	Yes, for adolescents younger than 18 years
Spousal consent for married women to access sexual and reproductive health services	No
Mandatory HIV testing for marriage, work or residence permits or for certain groups	Yes

STIGMA AND DISCRIMINATION

Percentage of women and men aged 15–49 years who report discriminatory attitudes towards people living with HIV

Percentage of people living with HIV denied health services because of their HIV status in the last 12 months

Percentage of people living with HIV who reported a health-care professional told others about their HIV status without their consent

VIOLENCE

Proportion of ever-married or partnered women aged 15–49 years who experienced physical or sexual violence from a male intimate partner in the past 12 months

MIDDLE EAST AND NORTH AFRICA

DATA POINTS

NEW INFECTIONS

INCREASED BY 22%

IN 2010–2019, WHILE AIDS-RELATED DEATHS REMAINED STABLE

WITH AN

INCIDENCE: PREVALENCE RATIO OF 8.2%,

THE REGION IS FAR FROM CONTROLLING ITS HIV EPIDEMIC

TWO THIRDS OF NEW INFECTIONS ARE AMONG MEN,

MOSTLY MEN WHO INJECT DRUGS AND GAY MEN AND OTHER MEN WHO HAVE SEX WITH MEN

WOMEN LIVING WITH AND AFFECTED BY HIV

REMAIN VULNERABLE, WITH LIMITED ACCESS TO SERVICES

52% OF PEOPLE LIVING WITH HIV

KNEW THEIR STATUS IN 2019, 38% WERE ACCESSING ANTIRETROVIRAL THERAPY, AND LESS THAN ONE THIRD WERE VIRALLY SUPPRESSED

The HIV epidemic in the Middle East and North Africa is still growing. The estimated 20 000 [11 000–38 000] new infections in 2019 marked a 25% increase over the 16 000 [8700–31 000] new infections in 2010.

The epidemic in the region is highly concentrated among key populations and their sexual partners. People who inject drugs accounted for 43% of new HIV infections in 2019, and gay men and other men who have sex with men another 23%. Combination prevention programmes focusing on key populations need to expand, including the use of HIV self-testing to increase coverage of PrEP and HIV treatment. Women living with and affected by HIV in the region are particularly vulnerable to gender-based violence and stigma and discrimination, resulting in limited access to HIV services. Coverage of services for the prevention of mother-to-child HIV transmission is among the lowest in the world.

The ongoing humanitarian emergencies in the region—and the associated large-scale movements of people—present massive challenges for public health systems in general and HIV programmes in particular. Community-based organizations can play important roles in the region's HIV response, but they are constrained in many countries by limited civic space and resources. Punitive laws and widespread stigma against people living with HIV and key populations pose additional difficulties.

Ending the AIDS epidemic in the region by 2030 requires renewing political leadership, addressing gender equality, securing sufficient and sustainable financing and scaling up the implementation of innovative programmes, such as HIV self-testing and pre-exposure prophylaxis (PrEP) using rights-based and evidence-informed approaches.

Reports of stigma and discrimination and violence among women at risk of or living with HIV in the multicountry LEARN MENA study, April to December 2018

Sources: Salamander Trust, Frontline AIDS, South African Medical Research Council, MenaRosa, Positive Women's Network. ALIV[H]E in action: key examples of the action linking initiatives on violence against women and HIV everywhere (ALIV[H]E) framework. London: Salamander Trust; 2019 (https://salamandertrust.net/wp-content/uploads/2017/11/ALIVHE_in_Action_FINAL_Salamander_et_al_March2019.pdf, accessed 12 June 2020); Linkages between HIV and gender-based violence in the Middle East and North Africa: key findings from the LEARN MENA project. LEARN MENA; 2018 (http://frontlineaids.org/wp-content/uploads/2019/02/Linkages_between_HIV_and_gender-based_violence_in_MENA_original.pdf, accessed 12 June 2020).

Note: LEARN MENA is a project that explores the linkages between violence against women and HIV in the Middle East and North Africa. It is led by women living with or at higher risk of HIV. Participants reside in seven countries: Algeria, Egypt, Jordan, Lebanon, Morocco, Sudan and Tunisia.

Violence is both a cause and consequence of HIV. Findings from the LEARN MENA project have reinforced existing evidence on this two-way relationship between HIV and gender-based violence, and how that violence is underpinned and sustained by inequitable gender norms. More than half (54%) of the women participating in the project said that violence or fear of violence had affected their ability to protect themselves from

acquiring HIV, and two thirds reported experiences of violence in health-care settings. Governments, development partners and civil society should ensure that women living with HIV and those affected by the epidemic are at the forefront of transformational and systematic change across all levels. There is an urgent need to review and reform laws and policies that expose women in all their diversity to gender-based violence.

Gaps in knowledge of status, HIV treatment and viral suppression by sex, countries with estimates for all three 90–90–90 targets, Middle East and North Africa, 2019

Source: UNAIDS epidemiological estimates, 2020 (see <https://aidsinfo.unaids.org/>).

Knowledge of HIV status, treatment access and viral suppression varies between men and women living with HIV in the region. Access to testing and treatment services is improving in some countries, such as Algeria and Morocco, but due

to poor service coverage in several other countries, only 38% [25–63%] of people living with HIV in the region were accessing antiretroviral therapy in 2019.

90–90–90 country scorecard, Middle East and North Africa, 2019

	First 90: percentage of people living with HIV who know their status			Second 90: percentage of people who know their status who are on treatment			Third 90: percentage of people living with HIV on treatment who are virally suppressed			Viral load suppression: percentage of people living with HIV who are virally suppressed

Note: Data for Jordan for 2017–2018 are for currently married women only.

Availability of harm reduction services and HIV prevalence among people who inject drugs, select countries with available data, Middle East and North Africa, 2019

Antiretroviral therapy coverage among people living with HIV and universal health coverage, Middle East and North Africa, 2019

Source: The Global Health Observatory [database]. Geneva: WHO; c2020 (<https://www.who.int/data/gho/data/major-themes/universal-health-coverage-major>).

Notes: The Universal Health Coverage Index is a measure of Sustainable Development Goal Indicator 3.8.1, which is coverage of essential health services (defined as the average coverage of essential services based on tracer interventions that include reproductive, maternal, newborn and child health, infectious diseases, noncommunicable diseases, and service capacity and access among the general and most disadvantaged population). Average availability of recent primary data (since 2010) across tracer indicators was used to compute the Universal Health Care Coverage Index. For more information, please see: <https://apps.who.int/gho/portal/uhc-service-coverage-v3.jsp>

Investing to end AIDS

Funding in 2019 for HIV responses in the region was just 19% of the 2020 target. Financing steadily increased between 2015 and 2018, followed by a 23% decline between 2018 and 2019.

Domestic funding accounted for 77% of total HIV financing in 2019. The Global Fund to Fight AIDS, Tuberculosis and Malaria (the Global Fund) provided 14%, the United States Government

provided 2% and other international sources provided 7% of the total. The HIV resource availability from domestic sources increased (after controlling for inflation by comparing constant 2016 US dollars) by 28% from 2010 to 2019, while the resources from the United States government, the Global Fund and all other international sources decreased by 80%, 69% and 30%, respectively.

Resource availability for HIV by source, 2010–2019, and estimated Fast-Track resource needs in 2020, Middle East and North Africa

LAWS AND POLICIES

Laws criminalizing the transmission of, non-disclosure of or exposure to HIV transmission ...

Criminalization of sex work among consenting adults Sex work is not subject to punitive regulations or is not criminalized

Criminalization of same-sex sexual acts Yes, imprisonment (up to 14 years)

Drug use or possession for personal use is an offence ...

Criminalization of transgender people ...

Laws or policies restricting the entry, stay and residence of people living with HIV Require HIV testing or disclosure for some permits

Parental consent for adolescents to access HIV testing ...

Spousal consent for married women to access sexual and reproductive health services ...

Mandatory HIV testing for marriage, work or residence permits or for certain groups ...

STIGMA AND DISCRIMINATION

Percentage of women and men aged 15–49 years who report discriminatory attitudes towards people living with HIV

Percentage of people living with HIV denied health services because of their HIV status in the last 12 months

Percentage of people living with HIV who reported a health-care professional told others about their HIV status without their consent

VIOLENCE

Proportion of ever-married or partnered women aged 15–49 years who experienced physical or sexual violence from a male intimate partner in the past 12 months

LAWS AND POLICIES

Laws criminalizing the transmission of, non-disclosure of or exposure to HIV transmission	No
Criminalization of sex work among consenting adults	Any criminalization or punitive regulation of sex work
Criminalization of same-sex sexual acts	Yes, death penalty
Drug use or possession for personal use is an offence	Possession of drugs for personal use or drug use or consumption are specified as a criminal offence
Criminalization of transgender people	...
Laws or policies restricting the entry, stay and residence of people living with HIV	Deport, prohibit short- and/or long-stay and require HIV testing or disclosure for some permits
Parental consent for adolescents to access HIV testing	Yes, for adolescents younger than 18 years
Spousal consent for married women to access sexual and reproductive health services	No
Mandatory HIV testing for marriage, work or residence permits or for certain groups	Yes

STIGMA AND DISCRIMINATION

Percentage of women and men aged 15–49 years who report discriminatory attitudes towards people living with HIV (2014 refers to women only)	2010	2014
	65.9	66

Percentage of people living with HIV denied health services because of their HIV status in the last 12 months

Percentage of people living with HIV who reported a health-care professional told others about their HIV status without their consent

VIOLENCE

Proportion of ever-married or partnered women aged 15–49 years who experienced physical or sexual violence from a male intimate partner in the past 12 months

EASTERN EUROPE AND CENTRAL ASIA

DATA POINTS

94% OF PREGNANT WOMEN

LIVING WITH HIV IN THE
REGION ARE ACCESSING
ANTIRETROVIRAL THERAPY

SINCE 2010, NEW HIV INFECTIONS
IN THE REGION HAVE

INCREASED 72%,
AND AIDS-RELATED DEATHS
HAVE INCREASED 24%

48% OF INFECTIONS

IN THE REGION ARE AMONG
PEOPLE WHO INJECT DRUGS

AMONG WOMEN WHO HAVE NEWLY
ACQUIRED HIV, NEARLY

**TWO THIRDS INJECT
DRUGS OR SELL SEX**

Eastern Europe and central Asia is one of only three regions where the HIV epidemic is growing. In 2019, the incidence:prevalence ratio of 10.1 was higher than in any other region. There is an urgent need to scale up HIV prevention services, especially in the Russian Federation, and there is a large gap between HIV testing and treatment initiation. Just 63% [52–71%] of people living with HIV who know their HIV status in the region are on treatment, leaving only 41% [34–46%] of all people living with HIV in the region virally suppressed.

Key populations and their sexual partners are disproportionately impacted, accounting for 99% of new HIV infections in 2019. High levels of stigma and discrimination faced by lesbian, gay, bisexual, transgender and intersex (LGBTI) people and people living with HIV impede the provision of effective combination HIV prevention services. High levels of physical, sexual and emotional violence towards women and girls are also significant barriers to HIV services.

Major efforts are needed to reverse current trends, including increased provision of community-led HIV services—such as HIV self-testing, harm reduction and pre-exposure prophylaxis (PrEP)—that are focused on the most affected groups. Community-based organizations require increased capacity-building support and adequate funding to play their critical role. Improved domestic funding of the national HIV response is also required to minimize dependence on international donors, particularly for key populations programming.

Investing to end AIDS

Resource availability for HIV by source, 2010–2019, and estimated Fast-Track resource needs in 2020, eastern Europe and central Asia

Source: UNAIDS financial estimates, 2020 (see <http://hivfinancial.unaids.org/hivfinancialdashboards.html>).

Funding for HIV responses in eastern Europe and central Asia (excluding the Russian Federation) peaked in 2017, before declining by 14% between 2017 and 2019, leaving the region at just 56% of its 2020 resource target.

The main funding source for the region's HIV response is domestic funding, accounting for 67% of the total in 2019. That same year, United States Government bilateral sources provided 10% of the total, the Global Fund to Fight AIDS, Tuberculosis and Malaria (the Global Fund) provided 15% and other international donors provided 9%.

HIV response funding from domestic sources increased by 24% from 2010 to 2019, while contributions from the Global Fund and all other

international sources decreased by 10% (all trends are measured in constant 2016 US dollars to control for inflation). Bilateral United States Government funding tripled during the nine-year period.

The longer term trends obscure a recent decline in resources for HIV responses. Between 2017 and 2019, increased contributions from United States Government bilateral and Global Fund sources of 2% and 6%, respectively, were outweighed by decreases in domestic resource availability and financing from other international sources of 9% and 10%, respectively. The Global Fund was the only source that increased its funding between 2018 and 2019.

Total HIV resource availability per person living with HIV, HIV incidence and AIDS-related mortality rates in low- and middle-income countries, eastern Europe and central Asia, 2010–2019 and 2020 target

Source UNAIDS financial estimates, 2020 (see <http://hivfinancial.unaids.org/hivfinancialdashboards.html>).

Note: Resource availability per person living with HIV and resource needs are in constant 2016 US dollars.

LAWS AND POLICIES

Laws criminalizing the transmission of, non-disclosure of or exposure to HIV transmission	Yes
Criminalization of sex work among consenting adults	Any criminalization or punitive regulation of sex work
Criminalization of same-sex sexual acts	Laws penalizing same-sex sexual acts have been decriminalized or never existed
Drug use or possession for personal use is an offence	Possession of drugs for personal use or drug use and/or consumption are specified as criminal offences
Criminalization of transgender people	Neither criminalized nor prosecuted
Laws or policies restricting the entry, stay and residence of people living with HIV	Prohibit short- and/or long-stay and require HIV testing or disclosure for some permits
Parental consent for adolescents to access HIV testing	Yes, for adolescents younger than 18 years
Spousal consent for married women to access sexual and reproductive health services	No
Mandatory HIV testing for marriage, work or residence permits or for certain groups	Yes

STIGMA AND DISCRIMINATION

Percentage of women and men aged 15–49 years who report discriminatory attitudes towards people living with HIV (2014 refers to women only)	2014	2018
	73.7	67

Percentage of people living with HIV denied health services because of their HIV status in the last 12 months	2015
	9.1

Percentage of people living with HIV who reported a health-care professional told others about their HIV status without their consent	2015
	31.3

VIOLENCE

Proportion of ever-married or partnered women aged 15–49 years who experienced physical or sexual violence from a male intimate partner in the past 12 months

LAWS AND POLICIES

Laws criminalizing the transmission of, non-disclosure of or exposure to HIV transmission	Yes
Criminalization of sex work among consenting adults	Any criminalization or punitive regulation of sex work
Criminalization of same-sex sexual acts	Laws penalizing same-sex sexual acts have been decriminalized or never existed
Drug use or possession for personal use is an offence	Possession of drugs for personal use or drug use and/or consumption are specified as criminal offences
Criminalization of transgender people	Neither criminalized nor prosecuted
Laws or policies restricting the entry, stay and residence of people living with HIV	Prohibit short- and/or long-stay and require HIV testing or disclosure for some permits
Parental consent for adolescents to access HIV testing	Yes, for adolescents younger than 14 years
Spousal consent for married women to access sexual and reproductive health services	No
Mandatory HIV testing for marriage, work or residence permits or for certain groups	No

STIGMA AND DISCRIMINATION

Percentage of women and men aged 15–49 years who report discriminatory attitudes towards people living with HIV

Percentage of people living with HIV denied health services because of their HIV status in the last 12 months	2013 11
---	-------------------

Percentage of people living with HIV who reported a health-care professional told others about their HIV status without their consent	2013 23
---	-------------------

VIOLENCE

Proportion of ever-married or partnered women aged 15–49 years who experienced physical or sexual violence from a male intimate partner in the past 12 months

INCLUDING TRANSGENDER PEOPLE (6.9%) AND GAY MEN AND OTHER MEN WHO HAVE SEX WITH MEN (5.8%)

KEY POPULATIONS AND THEIR SEX PARTNERS ACCOUNTED FOR

**96% OF HIV
INFECTIONS IN THE
REGION IN 2019**

Strong HIV responses in most of western and central Europe and North America have seen this high-income region achieve an incidence:prevalence ratio of 3.0, which signals steady reductions in new HIV infections and that most people living with HIV are accessing treatment and living long and healthy lives.

HIV testing and treatment coverage in the region is approaching the 2020 targets, with 88% [70–100%] of people living with HIV knowing their HIV status, 81% [62–98%] on treatment and 67% [53–80%] with durably suppressed viral loads. High coverage of pre-exposure prophylaxis (PrEP) in several cities of the region has contributed to reductions in new HIV infections among gay men and other men who have sex with men.

This aggregate success obscures many challenges. In western and central Europe, undocumented migrants living in insecure and precarious situations have less access to HIV services, including HIV treatment and new prevention tools (such as PrEP). In the United States of America, black and Latino people are disproportionately affected by HIV, with HIV diagnosis rates that are several-fold higher than among whites and Asians.

Gay men and other men who have sex with men accounted for nearly two thirds of new HIV infections in the region in 2019. More than one third (36%) of total infections were among young gay men and other men who have sex with men (aged 15 to 24 years).

Access to antiretroviral therapy for undocumented migrants, western and central Europe, 2018

Source: HIV and migrants: monitoring implementation of the Dublin Declaration on partnership to fight HIV/AIDS in Europe and Central Asia (2018 progress report). Stockholm: European Centre for Disease Prevention and Control; 2019 (<https://www.ecdc.europa.eu/en/publications/hiv-migrants-monitoring-implementation-dublin-declaration-2018-progress-report>).

Note: the "key" indicator that best describes the experience of access to treatment for undocumented migrants (as identified by countries) is recorded.

Rate of new HIV diagnoses in the United States of America, by ethnic group, 2018

Rate of HIV diagnoses, by state, United States of America, 2018

Source: Table 18. Diagnoses of HIV Infection, by Area of Residence, 2017 and 2018—United States and 6 Dependent Areas. In: Diagnoses of HIV Infection in the United States and Dependent Areas, 2018: Diagnoses [database]. Last reviewed 7 May 2020. Atlanta: United States Centers for Disease Control and Prevention; c2020 (<https://www.cdc.gov/hiv/library/reports/hiv-surveillance/vol-31/content/tables.html>).

Note: Rates are per 100 000 population and represent new HIV diagnoses amongst adults and adolescents (aged 13 years and older), 2018.

The HIV epidemics within both North America and western and central Europe have important geographic differences. New diagnoses continue to decline in the United States, but there is substantial variation by subpopulation, geography

and ethnicity. Many southern states have much higher rates of HIV diagnosis than the national average, as do California, Maryland, the District of Columbia, Nevada and New York.

Estimated new HIV infections in West and Centre Europe, by region, 2010–2019

Note: The figure reflects the West and Centre subregions of the WHO European Region with the following modifications. The Centre subregion was modified to reflect the UNAIDS western and central Europe subregion: Estonia, Latvia and Lithuania are included, and Albania, Bosnia and Herzegovina, Montenegro and North Macedonia are excluded. Source: UNAIDS special analysis, 2020, using UNAIDS epidemiological estimates 2010–2020 (see methods section and <https://aidsinfo.unaids.org/>).

There are stark differences in the trends of new HIV infections in western Europe and central Europe. The 20 countries in the western part of the continent saw a 30% decline in infections between

2010 and 2019, while annual HIV infections in 14 countries in central Europe saw HIV infections rise by 45% over the same period.

HIV testing and treatment

HIV testing and treatment cascade, western and central Europe and North America, 2019

Source: UNAIDS special analysis, 2020 (see methods annex).

Late HIV diagnosis among women, by age group, western Europe, 2018

Source: Mårdh O, Quinten C, Kuchukhidze G, Seguy N, Dara M, Amato-Gauci A et al. HIV among women in the WHO European Region – epidemiological trends and predictors of late diagnosis, 2009–2018. *Eurosurveillance*. 2019;24(48):pii=1900696.
 Note: Adjusted odds ratios with whiskers representing 95% confidence intervals. Late diagnosis defined as CD4 $\leq$ 350 cells/mm³ at diagnosis. Reference population is women diagnosed with HIV aged 15 to 19 years. Sample size = 3614.

More than half of women diagnosed with HIV in the World Health Organization (WHO) European Region in 2018 were diagnosed late, and late diagnosis was much more common among

older women living with HIV. Understanding the characteristics of women diagnosed with HIV can inform gender-sensitive prevention services, including PrEP and early testing and linkage to care.

HIV TESTING AND TREATMENT CASCADE

HIV COMORBIDITIES

Estimated number of incident tuberculosis cases among people living with HIV (2018) 86 [28–180]

People living with HIV who started TB preventive therapy (2018) ...

Cervical cancer screening of women living with HIV ...

People coinfectd with HIV and hepatitis C virus starting hepatitis C treatment ...

HIV PREVENTION

Adults aged 15+ years with unsuppressed viral load ...

Knowledge of HIV prevention among young people aged 15–24 years

— Women ...
— Men ...

Condom use at last sex with a non-marital, non-cohabiting partner among people aged 15–49 years

— Women ...
— Men ...

Women aged 15–49 years who have their demand for family planning satisfied by modern methods ...

Men aged 15–49 years who are circumcised Not applicable

Voluntary medical male circumcisions performed according to national standards Not applicable

People who received PrEP at least once during the reporting period ...

Harm reduction

— Use of sterile injecting equipment at last injection (2019) 92.3%
— Needles and syringes distributed per person who injects ...
— Coverage of opioid substitution therapy ...
— Naloxone available (2019) Yes
— Safe injection rooms available (2019) Yes

COUNTRY DATA

LAWS AND POLICIES

Laws criminalizing the transmission of, non-disclosure of or exposure to HIV transmission	No, but prosecutions exist based on general criminal laws
Criminalization of sex work among consenting adults	Any criminalization or punitive regulation of sex work
Criminalization of same-sex sexual acts	Laws penalizing same-sex sexual acts have been decriminalized or never existed
Drug use or possession for personal use is an offence	Possession of drugs for personal use or drug use and/or consumption are specified as criminal offences
Criminalization of transgender people	Neither criminalized nor prosecuted
Laws or policies restricting the entry, stay and residence of people living with HIV	No
Parental consent for adolescents to access HIV testing	No
Spousal consent for married women to access sexual and reproductive health services	No
Mandatory HIV testing for marriage, work or residence permits or for certain groups	Yes

STIGMA AND DISCRIMINATION

Percentage of women and men aged 15–49 years who report discriminatory attitudes towards people living with HIV

Percentage of people living with HIV denied health services because of their HIV status in the last 12 months

Percentage of people living with HIV who reported a health-care professional told others about their HIV status without their consent

VIOLENCE

Proportion of ever-married or partnered women aged 15–49 years who experienced physical or sexual violence from a male intimate partner in the past 12 months

2014

1.7

ANNEX ON METHODS

Part 1. Methods for deriving UNAIDS HIV estimates

Introduction

UNAIDS annually provides revised global, regional and country-specific modelled estimates using the best available epidemiological and programmatic data to track the HIV epidemic. Modelled estimates are required because it is impossible to count the exact number of people living with HIV, people who are newly infected with HIV or people who have died from AIDS-related causes in any country: doing so would require regularly testing every person for HIV and investigating all deaths, which is logistically impossible and ethically problematic. Modelled estimates—and the lower and upper bounds around these estimates—provide a scientifically appropriate way of describing HIV epidemic levels and trends.

Partnerships in developing methods for UNAIDS estimates

Country teams use UNAIDS-supported software to develop estimates annually. The country teams are primarily comprised of monitoring and evaluation specialists, programme officers, epidemiologists, demographers and others from the national ministry of health, national AIDS bodies and technical partners.

The software used to produce the estimates is Spectrum (developed by Avenir Health) with additional models that interact with Spectrum to estimate HIV incidence.¹ The UNAIDS Reference Group on Estimates, Modelling and Projections provides technical guidance on the development of the HIV component of the software.²

A brief description of methods used by UNAIDS to create estimates³

For countries where HIV transmission is high enough to sustain an epidemic in the general population, available epidemiological data typically consist of HIV prevalence results from pregnant women attending antenatal clinics and from nationally representative population-based surveys. Many countries have historically conducted HIV sentinel surveillance among women attending antenatal clinics, which requires collecting data

from a selection of clinics for a few months every few years. More recently, a number of countries have stopped conducting sentinel surveillance among pregnant women and are now using the data from the routine HIV tests conducted when pregnant women attend antenatal clinics and are tested for HIV. These data avoid the need to conduct a separate surveillance effort, and they provide a complete set of data from all clinics across the country instead of samples from specific sites.

The trends from pregnant women at antenatal clinics, whether done through surveillance or routine data, can be used to inform estimates of national prevalence trends, whereas data from population-based surveys—which are conducted less frequently but have broader geographical coverage and also include men—are more useful for informing estimates of national HIV prevalence levels. Data from these surveys also contribute to estimating age- and sex-specific HIV prevalence and incidence levels and trends. For a few countries in sub-Saharan Africa that have not conducted population-based surveys, HIV prevalence levels are adjusted based on comparisons of antenatal clinic surveillance and population-based survey data from other countries in the region. HIV prevalence trends and numbers of people on antiretroviral therapy are then used to derive an estimate of HIV incidence trends.

Historically, countries with high HIV transmission have produced separate HIV prevalence and incidence trends for rural and urban areas when there are well-established geographical differences in prevalence. To better describe and account for further geographical heterogeneity, an increasing number of countries have produced subnational estimates (e.g., at the level of the province or state) that, in some cases, also account for rural and urban differences. These subnational or rural–urban estimates and trends are then aggregated to obtain national estimates.

¹ More information on Avenir Health can be found at www.avenirhealth.org.

² For more on the UNAIDS Reference Group on Estimates, Modelling and Projections, please visit www.epidem.org.

³ A set of articles describing the methods is available in a 2019 supplement (Volume 33, Supplement 3) of the journal AIDS: <https://journals.lww.com/aidsonline/toc/2019/12153>.

In the remaining countries, where HIV transmission occurs largely among key populations at higher risk of HIV and the epidemic can be described as low-level, the estimates are derived from either surveillance among key populations and the general, low-risk population, or from HIV case reporting data, depending on which data are most reliable in a particular country. In countries with high-quality HIV surveillance data among the key populations, the data from repeated HIV prevalence studies that are focused on key populations are used to derive national estimates and trends. Estimates of the size of key populations are increasingly derived empirically in each country; when studies are not available, they are derived based on regional values and consensus among experts. Other data sources—including HIV case reporting data, population-based surveys and surveillance among pregnant women—are used to estimate the HIV prevalence in the general, low-risk population. The HIV prevalence curves and numbers of people on antiretroviral therapy are then used to derive national HIV incidence trends.

For most countries in western and central Europe and North America—and many countries in Latin America, the Caribbean, and the Middle East and North Africa that have insufficient HIV surveillance or survey data, but that have robust disease reporting systems—HIV case reporting and AIDS-related mortality data from vital registration systems are used to inform trends and levels in national HIV prevalence and incidence. These methods also allow countries to take into account evidence of underreporting or reporting delays in HIV case report data, as well as the misclassification of deaths from AIDS-related causes.

In all countries where UNAIDS supports the development of estimates, assumptions about the effectiveness of HIV programme scale-up and patterns of HIV transmission and disease progression are used to obtain age- and sex-specific estimates of people living with HIV, people newly infected with HIV, people dying from AIDS-related illness and other important indicators (including treatment programme coverage statistics). These assumptions are based on systematic literature reviews and analyses of raw study data by scientific experts. Demographic population data, including fertility estimates,

are derived from the United Nations Population Division's *World population prospects 2019* data files or recent census data (1).

Selected inputs into the model—including the number of people on antiretroviral therapy and the number of women accessing services to prevent the vertical transmission of HIV—are reviewed and validated in partnership with the United Nations Children's Fund (UNICEF), the World Health Organization (WHO), the Government of the United States of America, the Global Fund to Fight AIDS, Tuberculosis and Malaria (the Global Fund), and other partners.

Final country-submitted files containing the modelled outputs are reviewed at UNAIDS to ensure that the results are comparable across regions and countries and over time.

In 2020, subnational estimates were created and used by 39 countries in sub-Saharan Africa. The methods for creating these subnational estimates are provided in Part 4 of this annex.

Uncertainty bounds around UNAIDS estimates

The estimation software calculates uncertainty bounds around each estimate. These bounds define the range within which the true value lies (if it can be measured). Narrow bounds indicate that an estimate is precise, while wide bounds indicate greater uncertainty regarding the estimate.

In countries using HIV surveillance data, the quantity and source of the available data partly determine the precision of the estimates: countries with more HIV surveillance data have smaller ranges than countries with less surveillance data or smaller sample sizes. Countries in which a national population-based survey has been conducted generally have smaller ranges around estimates than countries where such surveys have not been conducted. Countries producing subnational estimates at the provincial level have wider ranges. In countries using HIV case reporting and AIDS-related mortality data, the number of years of data and the magnitude of the cases reported or AIDS-related deaths observed will contribute to determining the precision of the estimate.

The assumptions required to arrive at the estimate also contribute to the extent of the ranges around

the estimates: in brief, the more assumptions, the wider the uncertainty range, since each assumption introduces additional uncertainties. For example, the ranges around the estimates of adult HIV prevalence are smaller than those around the estimates of HIV incidence among children, which require additional data on prevalence among pregnant women and the probability of mother-to-child HIV transmission that have their own additional uncertainty.

UNAIDS is confident that the actual numbers of people living with HIV, people who are newly infected with HIV or people who have died from AIDS-related causes lie within the reported ranges. Over time, more and better data from countries will steadily reduce uncertainty.

Improvements included in the 2020 UNAIDS estimates model

Country teams create new Spectrum files every year. The files may differ from one year to the next for two reasons. First, new surveillance and programme data are entered into the model; this can change HIV prevalence and incidence trends over time or antiretroviral therapy coverage rates, including for past years. Second, improvements are incorporated into the model based on the latest available science and statistical methods, which leads to the creation of more accurate trends in HIV incidence. Occasionally, countries will also change the incidence modelling option within Spectrum based on improvements in the data available in the country. Due to these improvements to the model and the addition of new data to create the estimates, the results from previous years cannot be compared with the results from this year. A full historical set of estimates are created each year, however, enabling a description of trends over time.

Between the 2019 estimates and the 2020 estimates, the following changes were applied to the model under the guidance of the UNAIDS Reference Group on Estimates, Modelling and Projections and based on the latest scientific evidence.

Breastfeeding among women living with HIV

In 2020, a new option was added to allow countries to enter antiretroviral therapy drop-off rates for breastfeeding women during the first year of breastfeeding and for 12 or more months. This reflects research showing that the first year of breastfeeding had higher drop-out levels than subsequent years (2).

In addition, the patterns of breastfeeding duration for women living with HIV were updated. In previous versions of the software, data from a recent population-based survey informed the distribution of breastfeeding duration. In the 2020 model, however, the distribution was improved to use a distribution from the region by HIV status of the woman to improve the accuracy of those estimates.

Changes to case surveillance and vital registration model

Under the technical guidance of the UNAIDS Reference Group on Estimates, Modelling and Projections, the Case Surveillance and Vital Registration model fitting tool was modified to fit to age- and sex-specific new diagnosis and mortality data. The option to fit to CD4 count data at the time of diagnosis from case surveillance systems was dropped from the model, while additional analyses are being conducted to assess the utility of these data.

Revisions to the HIV diagnosis model were made to permit a more flexible diagnosis rate, which included an initial "pulse" of HIV testing and a "second wave" of HIV testing that follows a logistic curve, as well as the addition of HIV testing driven by opportunistic infections. Finally, fitting approaches using the double logistic and spline curve fitting were modified to improve curve fits.

At the global level, trends in new HIV infections, AIDS-related deaths and people living with HIV are similar to the 2019 round, although there are shifts within regions (see Figure).

Comparison of 2019 to 2020 UNAIDS estimates: new HIV infections, AIDS-related deaths and people living with HIV, global, 2000–2019

Publication of country-specific estimates

UNAIDS aims to publish estimates for all countries with populations of 250 000 or more (based on population estimates from the United Nations Population Division *World population prospects 2019*) (1). For the countries with populations of 250 000 or more that did not submit estimates, UNAIDS developed estimates using the Spectrum software, based on published or otherwise available information. These estimates contributed to regional and global totals, but they were not published as country-specific estimates.

In countries with low-level epidemics, the number of pregnant women living with HIV is difficult to estimate. Many women living with HIV in these countries are sex workers or people who use drugs—or they are the sexual partners of people who use drugs or gay men and other men who have sex with men—making them likely to have different fertility levels than the general population. UNAIDS does not present estimates of mother-to-child HIV transmission, including estimates related to children in some countries that have concentrated epidemics, unless adequate data are available to validate these estimates. UNAIDS also does not publish estimates related to children for countries where the estimated number of pregnant women living with HIV is less than 50.

With regard to reporting incidence trends, if there are not enough historical data to state with confidence whether a decline in incidence has occurred, UNAIDS will only publish data for the most recent year. This is done to prevent users from making inaccurate inferences about trends. Specifically, incidence trends are not published if there are fewer than four data points for the key population or if there have been no data for the past four years for countries using repeated survey or routine testing data. Trends prior to 2000 are not published for countries using case surveillance models if there are no early case surveillance or mortality data available.

Finally, UNAIDS does not publish country estimates when further data or analyses are needed to produce justifiable estimates. More information on the UNAIDS estimates and the individual Spectrum files for most countries can be found on the UNAIDS website (www.unaids.org). Data from the estimates can be found in the AIDInfo section of the UNAIDS website (<http://aidsinfo.unaids.org>).

Part 2. Methods for deriving the 90–90–90 targets

Introduction

Since 2015, UNAIDS has reported estimates of global, regional and country-specific progress against the 90–90–90 targets. Progress toward these targets is monitored using three basic indicators:

- Indicator 1 (the first 90): The percentage of people living with HIV who know their HIV status.
- Indicator 2 (the second 90): The percentage of people living with HIV who know their status and are accessing treatment.
- Indicator 3 (the third 90): The percentage of people living with HIV on treatment who have suppressed viral loads.

Indicators 2 and 3 can also be expressed as a percentage of all people living with HIV. When numbers or coverage of the treatment target are expressed relative to the total number of people living with HIV, this is called “the HIV testing and treatment cascade.” Annual estimates of antiretroviral therapy coverage among people living with HIV are available from the time when treatment was first introduced in countries.

Data sources for constructing country measures

Country-level progress against the 90–90–90 targets was constructed using reported data from Spectrum, the Global AIDS Monitoring tool and (for selected countries in western and central Europe) the Dublin Declaration monitoring process. Estimates are published for all people and separately for children (0 to 14 years) and adults (15 years and older, by sex). Upper and lower ranges of uncertainty for country-level estimates were calculated from the range of estimated numbers of people living with HIV. This range may not fully capture uncertainty in the reported estimates.

A description of the target-related indicators that countries report against is provided in the UNAIDS 2019 Global AIDS Monitoring guidelines (3). Data sources are also briefly described. A summary of the number of countries that are publicly reporting

on each measure is provided in table on page 424, organized by region.

The final set of country measures of progress against the 90–90–90 targets for 2015 through 2019 are available at <http://aidsinfo.unaids.org>. Not all countries were able to report against all three prongs of the 90–90–90 targets: complete treatment cascades are published for 60 countries, the same as in the previous round.

Estimates of people living with HIV

All progress measures in this report are based on UNAIDS global, regional and country-specific modelled estimates from Spectrum of the numbers of people living with HIV. Estimates of people living with HIV are developed for all countries with populations greater than 250 000. More details about how UNAIDS derives estimates and uncertainty bounds around the number of people living with HIV can be found in Part 1 of this annex.

Estimates of people living with HIV in 2019 were available for 170 of 194 countries and territories, and they were published for 122. Published country estimates of people living with HIV (available at <http://aidsinfo.unaids.org>) represent 80% of the total global estimated number of people living with HIV in 2019.

Knowledge of HIV status among people living with HIV

Estimates of the number of people living with HIV who know their status were derived using the most recent HIV surveillance, programme data and nationally representative population-based survey data. Where data were available separately for children (aged 0–14 years) and adults (aged 15 years and older, by sex), the age- and sex-specific measures were first calculated and then aggregated to produce a national measure.

For countries outside of eastern and southern Africa and western and central Africa, published estimates of the number of people living with HIV who knew their HIV status are based on HIV surveillance case notification data, programme registers or modelled estimates derived from case surveillance data. If the estimate from these

sources was lower than the number of people accessing antiretroviral therapy, the reported value was excluded. For countries using HIV surveillance or programme data, a country should have included this measure only if the HIV surveillance system had been functioning since at least 2014 and people who have died, emigrated or have otherwise been lost to follow-up are removed.

Although HIV surveillance systems, including those based on programme registers, can be a reasonably robust source of data to estimate the number of people living with HIV who know their status, biases in the reported numbers may still exist. For example, a country's measure of the knowledge of status may be underestimated if not all people diagnosed are reported to the surveillance system in a timely manner. The measure also may be overestimated if people are reported to the system or included on a register more than once and these duplicates are not detected. Similarly, if people die or emigrate but are not removed from the system, the number of people living with HIV who are reported to know their HIV status also will be overstated.

For most countries in eastern and southern Africa and western and central Africa, estimates of the numbers of people living with HIV who knew their status were derived using the UNAIDS-supported mathematical model Shiny90. This model uses population-based survey and HIV testing service programme data—together with country-specific HIV epidemic parameters from the standard UNAIDS Spectrum model—to produce outputs of knowledge of HIV status for adults by sex. More details on the modelling approach are available elsewhere (4).

Knowledge of HIV status from the Shiny90 model for eastern and southern Africa and western and Central Africa has a number of strengths compared with other approaches that rely directly on population survey data and programme treatment coverage data. Most importantly, the Shiny90 model uses population survey data to estimate the proportion of people living with HIV who report ever having an HIV test who are aware of their HIV status and those who likely seroconverted after their last HIV-negative test. This distinction is informed by the national incidence trend calculated in Spectrum and is consistent with national published estimates of HIV prevalence and reported antiretroviral

therapy coverage. The Shiny90 tool also uses assumptions from Spectrum and the population survey data to estimate knowledge of status by sex and age, assuming male-to-female testing ratios have remained relatively constant over time. Estimates of knowledge of status are also available since 2010.

An important model limitation, similar to other estimation approaches, is that caution should be used in interpreting results in instances when the last population-based survey was conducted more than five years ago, or if there are concerns about the accuracy of self-reported testing history in the survey. Countries can include HIV testing data from HIV programmes to improve trends in years where the population survey data are not available. Another limitation is that model results are only for those aged 15 years and older. UNAIDS continues to recommend that countries conservatively estimate knowledge of status among children as the proportion of children living with HIV on treatment (unless other information from case surveillance data are available).

People accessing antiretroviral therapy

Global and regional measures of antiretroviral therapy numbers are abstracted from country-reported programme data through the UNAIDS-supported Spectrum software, the Global AIDS Monitoring reporting tool and the Dublin Declaration reporting process. In the 2020 round, 118 countries publicly reported treatment numbers, and between 2015 and 2019, 144 countries had at least one publicly available estimate of the number of people on treatment (representing 85% of all people on treatment). For the small number of countries where reported numbers of people on treatment are not available in selected years—primarily in western and central Europe and North America, and in China, India and the Russian Federation—estimates of the number of people on treatment are developed either in consultation with the public health agency responsible for monitoring the national treatment programme or based on published and unpublished sources.

In partnership with UNICEF, WHO, the United States Government, the Global Fund and other partners that support treatment service delivery in countries, UNAIDS annually reviews and validates treatment numbers that countries have reported

Credit: UNAIDS

to UNAIDS through Global AIDS Monitoring and Spectrum. UNAIDS staff also provide technical assistance and training to country public health and clinical officers to ensure the quality of the treatment data reported. Nevertheless, this measure may overestimate the number of people on treatment if people who transfer from one facility to another are reported by both facilities. Similarly, coverage may be overestimated if people who have died, disengaged from care or emigrated are not identified and removed from treatment registries. Treatment numbers also may be underestimated if not all clinics report the numbers on treatment completely or in a timely manner.

In 2016, UNAIDS completed a triangulation of data to verify the UNAIDS global estimate of people accessing antiretroviral therapy at the end of 2015. Since early 2017, UNAIDS and other international partners have supported more than 15 countries, primarily in sub-Saharan Africa, to verify that the number of people reported to be currently on treatment is accurate. For more details about how confident UNAIDS is in reported treatment numbers, please see *How many people living with HIV access treatment?*⁴

People who have achieved viral suppression

Progress towards the viral suppression target among people on treatment and as a proportion of all people living with HIV was derived from

data reported in Spectrum and through the online Global AIDS Monitoring reporting tool and the Dublin Declaration reporting process. For the purposes of reporting, the threshold for suppression is a viral load of less than 1000 copies per ml. Some countries may set lower thresholds or require persons to achieve an undetectable viral load, and where these lower thresholds are reported by a country, an estimate of the number of people who would have been suppressed at 1000 copies per ml is added to the number reported to be suppressed at the lower threshold. The Global AIDS Monitoring guidance describes this adjustment in more detail. This guidance also specifies that only a person's last test result from the reporting year should be submitted, so the reported number suppressed among those tested should represent people and not tests performed.⁵

UNAIDS 2019 Global AIDS Monitoring guidelines were revised from those of 2018 to clarify that countries should report viral load suppression outcomes, regardless of testing coverage. However, viral load testing results will only be published in countries where access to testing is nationally representative of all people on treatment (typically 50% or higher testing coverage). The table on page 424 shows the increase in the number of countries able to report on viral load suppression compared to previous years. In 2015, only 29 countries had reliable estimates; in 2019, there were 70 countries with reported data.

⁴ The document is available at <http://www.unaids.org/en/resources/documents/2016/how-many-people-living-with-HIV-access-treatment>.

⁵ This document is available at https://www.unaids.org/sites/default/files/media_asset/global-aids-monitoring_en.pdf.

Source: UNAIDS special analysis, 2020.

For countries with nationally representative but not universal access to viral suppression testing, the estimate of viral suppression among those tested (i.e., the third 90) was multiplied by the number of people on treatment to obtain overall viral suppression levels in the country.

A number of challenges exist in using country-reported data to monitor the viral load suppression target. First, routine viral load testing may not be offered at all treatment facilities,

and those facilities that do offer it may not be representative of the care available at facilities without viral load testing. Since it is not possible to know for certain suppression in the untested population, we assume that the percentage of people suppressed among those accessing viral load testing is representative of all people on treatment.

Another challenge in measuring the accuracy of viral load suppression estimates is that UNAIDS

guidance requests routine (e.g., annual) viral load testing results only for people who are on treatment and eligible for testing. If people newly initiated on treatment achieve viral suppression but have not yet been offered viral load testing, they will be incorrectly counted as not suppressed, and the resulting viral suppression estimate will be understated. UNAIDS also requests countries to only report results from routine viral load testing: if countries report test results primarily performed because of suspected treatment failure, the number of people virally suppressed in these countries will be underestimated. UNAIDS validates country submissions for quality, but it is not always possible to identify cases where both routine and other types of testing are occurring.

Finally, UNAIDS guidance recommends reporting viral load test results only for people on antiretroviral therapy; persons who are not on treatment and who naturally suppress the virus will not be included in this measure.

Methods for constructing the 90–90–90 treatment target at the regional and global levels

All programme data submitted to UNAIDS were validated by UNAIDS and its partners prior to publication. Country-submitted data that did not meet the required validation checks for quality either at the indicator level or across the treatment cascade were not included in the composite regional or global measures.

To estimate regional and global progress against the 90–90–90 targets, UNAIDS imputed missing country data for the first and third 90 targets using a Bayesian hierarchical model with uncertainty based on regional trends, sex differences and country-specific data for those countries reporting data for some but not all years. Estimates are available by sex for adults 15 years and older from 2015 to 2019. As in previous years, results of global and regional progress towards the 90–90–90 targets presented in this report supersede all previously published estimates. Additional details on the modelling approach are available elsewhere (5).

The proportion of estimates of knowledge of status and viral load suppression imputed by region from 2015 to 2019 to account for countries with missing data are shown in the

table on page 426. Due to large differences in the proportion of virally suppressed people in western and central Europe and the United States for the years in which data were available, subregional estimates were separately calculated for North America and western and central Europe and then combined to estimate the western and central Europe and North America regional results at large. Upper and lower ranges of uncertainty around the global and regional estimates of the HIV testing and treatment cascade are provided that reflect uncertainty in the number of people living with HIV and uncertainty (from missing country data) in the number of people who know their HIV status and the number of people who are virally suppressed. Based on reports from data quality reviews through 2019, uncertainty from possible overreporting or underreporting of treatment numbers was added to the bounds of treatment coverage among people living with HIV and the second and third 90s. Upper and lower ranges of uncertainty for the 90s do not capture uncertainty in the reported or missing programme data on the numbers of people who know their HIV status or the number of people on treatment who are virally suppressed.

One primary limitation that arises from incomplete availability of country estimates is that it is difficult to quantify the extent to which progress in countries that reported data to UNAIDS is similar to that of countries in the region that do not have data. This is particularly true for viral load suppression estimates, where reported data in some regions—especially in 2015 and 2016—are limited. For example, viral load testing coverage in western and central Africa was especially low between 2015 and 2017, with most estimates derived from countries reporting data in 2018 and 2019. In Asia and the Pacific, national-level estimates of viral load suppression are not available in any year for India and not prior to 2018 for China. In western and central Europe and North America, HIV testing and treatment reporting, including viral load suppression through the Dublin Declaration, was suspended due to the COVID-19 pandemic, and the last reported estimate of viral load suppression by the United States at the time of this report was 2016.

Proportion of imputed data of the number of people living with HIV who know their status and the number of people living with HIV on treatment who are virally suppressed, 2015–2019

		Asia and the Pacific	Caribbean	Eastern and southern Africa	Eastern Europe and central Asia	Latin America	Middle East and North Africa	Western and central Africa	Western and central Europe and North America	Global
Estimates of people living with HIV where knowledge of status is imputed (%)	2015	84	15	0	8	27	29	0	30	17
	2016	83	15	0	8	23	30	0	13	16
	2017	23	15	0	7	19	31	0	29	7
	2018	49	15	0	6	13	27	0	39	11
	2019	79	16	0	2	58	34	0	97	21
Estimates of people living with HIV on treatment where viral suppression is imputed (%)	2015	83	91	57	76	31	63	99	18	63
	2016	84	88	33	9	28	59	99	2	47

Part 3. Data on key populations

Distribution of new HIV infections by subpopulation

The distribution of new HIV infections among subpopulations globally and by region was estimated based on data for 170 countries using four data sources.

The underlying number of new infections for each country is estimated with Spectrum. New infections among men and women aged 15 to 49 years are used.

For countries that model their HIV epidemic based on data from subpopulations, including key populations, the numbers of new infections were extracted from Spectrum 2020 files. This source provided data for sex workers from 60 countries, for people who inject drugs from 37 countries, for gay men and other men who have sex with men from 62 countries, and for transgender people from 20 countries (all of which were located in Latin America, the Caribbean, and Asia and the Pacific). Additionally, 18 countries (mostly from Asia and the Pacific) had data from clients of sex workers.

New HIV infections for western and central European countries were derived from European Centre for Disease Prevention and Control (ECDC) and WHO Regional Office for Europe HIV/AIDS surveillance in Europe 2019 (2018 data) (6). The proportions of new diagnoses for each region in Europe (western, central and eastern) were applied to UNAIDS estimates of new infections in each country for people who inject drugs, gay men and other men who have sex with men, and transgender people. Data for sex workers were not available from the ECDC report. New HIV infections in China, India, the Russian Federation and the United States were taken from the most recent available national reports of new diagnoses or other published sources.

New HIV infections among countries without a direct data source were calculated from regional benchmarks. The benchmarks were set by the median proportion of new infections in the specific subpopulation in all available countries in the same region. The majority of these countries

Credit: UNAIDS

were located in sub-Saharan Africa. There were 115 countries that used benchmark values for the sex worker estimate, 97 countries for the people who inject drugs estimate, 72 countries for the gay men and other men who have sex with men estimate, and 143 countries for the transgender people estimate.

New infections among sex partners of key populations were estimated using the number of sex partners and transmission probabilities from the literature. These include non-injecting sex partners of people who inject drugs, female sex partners of gay men and other men who have sex with men, spouses/steady sexual partners of sex workers, clients of sex workers and the clients' spouses/steady sex partners.

Quality of population size estimates

Population size estimates are used to calculate the relative risks presented in this report. The Global AIDS Monitoring system collects population size estimates. Some of the submitted size estimates are considered subnational, and UNAIDS uses regional medians of the population proportions of submitted size estimates to fill in missing information or extrapolate from subnational estimates.

The regional sections of this report include tables on the estimated size of key populations. These data are based on values reported through Global AIDS Monitoring in 2018 and 2019. A comprehensive review of the data was conducted during these reporting rounds, and estimates therefore should not be compared with data presented in previous UNAIDS reports. As a result of this process, the estimates reported can be categorized as follows:

- “National population size estimate” refers to estimates that are empirically derived using one of the following methods: multiplier, capture–recapture, mapping/enumeration, network scale up method (NSUM) or population-based survey, or respondent-driven sampling-successive sampling (RDS-SS). Estimates had to be national or a combination of multiple sites with a clear approach to extrapolating to a national estimate.
- “Local population size estimate” refers to estimates that are empirically derived using one of the previously mentioned methods, but only for a subnational group of sites that are insufficient for national extrapolation.
- “Insufficient data” refers either to estimates derived from expert opinions, Delphi, wisdom of crowds, programmatic results or registry, regional benchmarks or unknown methods, or estimates derived prior to 2015. Estimates may or may not be national.

Part 4. Subnational HIV estimates for sub-Saharan Africa and the Caribbean

Subnational HIV estimates were generated for 38 countries in sub-Saharan Africa and also for Haiti in the Caribbean. The indicator displayed on the map on page 19 is the incidence of HIV infection among females aged 15 to 24 years by subnational level.

Two methods were used to generate the subnational estimates: the Naomi model was used by 21 countries (20 in sub-Saharan Africa and one in the Caribbean), while a simpler district disaggregation method was used for 18 other countries in sub-Saharan Africa (see table on page 430).

Naomi model: This model uses small area estimation to jointly model HIV prevalence and people living with HIV, antiretroviral therapy coverage and HIV incidence. The model combines subnational-level data about multiple outcomes from several sources in a Bayesian statistical model. It uses national population-based survey data and antiretroviral therapy and antenatal clinic testing service provision data to provide robust indicators of subnational HIV burden. It provides estimates and uncertainty ranges for a number of indicators (including HIV prevalence, people living with HIV, antiretroviral therapy coverage, HIV incidence and new infections) by sex, five-year age groups and subnational level.

The model produces estimates at three time points: the year of the most recent population-based survey, the year of the last round of HIV national estimates (2019), and short-term, one-year projections for HIV programme planning purposes. Subnational population estimates by sex and age group are sourced from consensus sources in each country and adjusted to match the populations used within Spectrum by sex and age group.

Cross-sectional estimates for HIV prevalence, antiretroviral therapy coverage and HIV incidence are produced at the mid-point of the most recent nationally representative household survey. For HIV prevalence, the model is calibrated to survey data on HIV prevalence by subnational level, sex and five-year age group from the most

recent population-based survey (Demographic and Health Survey or Population HIV Impact Assessment). Since the survey sample size in each district is relatively small, routinely reported data about HIV prevalence among pregnant women attending their first antenatal care visit, extracted from the national health information system, are used to improve estimates of the spatial pattern of HIV.

Antiretroviral therapy coverage by district, age and sex is estimated from population-based survey data about the presence of antiretroviral biomarkers in HIV-positive survey respondents. Routinely reported antiretroviral therapy coverage among pregnant women prior to their first antenatal care visit is used as a covariate for the spatial pattern of antiretroviral therapy coverage. The antiretroviral therapy coverage and HIV prevalence are also calibrated so that the total number on antiretroviral therapy matches that report in the Spectrum national file.

A challenge for estimating treatment coverage at the district level is that persons may access antiretroviral therapy services in a different district than their residence (for instance, if facilities are closer or felt to provide better services). The model allows for a probability that resident people living with HIV access antiretroviral therapy in a neighbouring district. The prior assumption is that the large majority of people living with HIV will access antiretroviral therapy in their district of residence, but this probability can vary based on district data about the number of people receiving antiretroviral therapy compared to HIV prevalence, antiretroviral therapy coverage and population.

Direct estimates of HIV incidence are not available at the subnational levels. While some recent household surveys have measured HIV incidence at the national level based on biomarker measures for recent HIV infections, too few recent infections are observed in any district to make a robust estimate. Therefore, to estimate HIV incidence at the subnational level, the HIV transmission rate from Spectrum estimates is calculated and applied to small area estimates of

HIV prevalence and antiretroviral therapy coverage in each subnational area. The sex and age distribution in each subnational area is based on HIV incidence rate ratios from Spectrum applied to the population structure in each area.

The model projects from the most recent household survey to the current period by creating a one-step projection of the population to 2019. Population estimates are updated with the latest official estimates. The number of people living with HIV is projected forward based on survival estimates by province, sex and age group from Spectrum over the same period (which accounts for HIV disease progression and the effects of antiretroviral therapy scale-up on reducing AIDS mortality). Antiretroviral therapy coverage is updated based on the number on treatment in 2019 from service provision data.

District disaggregation method: A tool was used to obtain subnational estimates for people living with HIV and new infections by disaggregating the national HIV estimates from the national Spectrum file. The disaggregation was done based on the distribution of people living with HIV aged 15 to 49 years and the subnational total population data provided by the national HIV estimates team. To produce these estimates, the tool requires inputs on the population aged 15 to 49 years, and HIV prevalence among people aged 15 to 49 years by subnational area. The tool first calculates the proportion of people living with HIV aged 15 to 49 years at the national level that are in each district. These proportions are then used to disaggregate other indicators calculated in the Spectrum file. The same distributions are applied to any age and sex group.

The incidence rate among young women aged 15 to 24 years was calculated as follows:

New infections among females aged 15 to 24 years in 2019 / (population of females aged 15 to 24 years—HIV-positive females aged 15 to 24 years) in 2019 * 1000.

Method used for subnational HIV estimates

Part 5. Laws and policies scorecards

The regional laws and policies scorecards were constructed based on data reported by countries through the 2017, 2018 and 2019 National Commitments and Policy Instrument, a component of Global AIDS Monitoring (3).

Data submitted by countries through the National Commitments and Policy Instrument are reviewed by UNAIDS. During this review process, UNAIDS

liaises with national Global AIDS Monitoring focal points to request clarification or to revise data submitted through the tool.

Data reported through the National Commitments and Policy Instrument have been complemented with data available from other sources, including global databases and primary sources.
