

CSF COVID-19 Vaccination Mapping

Monitoring access issues for the communities living or affected by HIV, TB and viral hepatitis, to share good practices and to act on identified gaps.

Information to be shared with CSF members to start with

The survey open => 30 June 2021.

Overall question on targeted actions: some report vaccination at shelters for homeless persons, drop-in centres for people using drugs, in prisons.

Several report that no targeted action are taken.

Several report access issues for undocumented migrants or those without insurance, with on-going advocacy

HIV

- 10 countries => Czech Republic, Denmark, Finland, Italy, Lithuania, Romania, Slovenia, Spain, Poland, Ukraine.
- In 10 => COVID-19 vaccination strategy at national level and some a mix of national and regional policies.
- In 8/10 => HIV amongst the conditions leading to some level of prioritization (variations based on CD4).
- Risk of unnecessary HIV status disclosure identified by some respondents: e.g. filling-in form where disclosure on condition justifying early vaccination is required. In one reported case, this was changed after protest. Several countries seem to have adopted central lists and not disclosing specific condition.
- Information is provided by healthcare providers; Community organisations; public authorities

Viral Hepatitis and Tuberculosis

2 reports of viral hepatitis being one of the comorbidities prioritised (late stage though)

Fill in the survey => 30 June 2021.
